I have gotten a KDK FM 2025markII at a ham fest and am having a few problems with it. The sound is very noisy. I need to get a manual and schematics for it so that the guy that fixes my ham stuff can see if he can fix it. Any help will be appreciated.

Thanks,

Elaine (kc0irb)

Switching supplies are smaller, lighter, and generate less heat. The down side is that they can generate RF noise if not properly designed.

The traditional analog supplies don't generate RF noise (usually) but they are bigger, heavier, and generate more heat.

The Jan 2000 issue of QST has a nice review of a number of the currently available switching supplies. The Astron SS-30M generates the least amount of noise. The Icom PS-85 is the worst of the bunch (and I think the most expensive). I just purchased an Astron SS-30M to power an IC756PRO. I don't detect any noise in the receiver unless I lay an antenna right next to the supply.

Thanks for the info. The reason i ask is that i currently have a very old Thomson/NPC 4AMP PS which i'm currently using on my Heathkit HW9. The 4 amps seems to be plenty for this QRP rig, but the PS has an annoying feature where it sporadically cuts off (not from a heavy draw of current). I'd like to get something to replace this one which would also be suitable for a future multimode/multiband HF rig.

Thanks for the tip for 1/2000 QST. I dug that out and found the reviews. It seems to only review PS's of the switching variety, but the Astron does seem to be favored by the article's author. The article shows a 'street price' of around $150. If I may ask, is that in line with what you paid?

Regarding the choice of switching -vs- analog, does operating mode play a factor in the choice? (ie: is the RF noise apparent in one mode more than another?)

--steve

I paid 139.99 for the Astron S-30M from AES http://www.aesham.com/

Regarding RF noise, the mode doesn't matter much. It is more frequency dependent. The article spectrum analyzer displays show where the greatest noise is usually at the low end of the HF spectrum. As I stated, I can't detect any RF noise unless I lay an antenna right next to the supply. By the way, the September 2000 issue of QST adds a couple additional switching supplies to the earlier review.

My choice of the Astron was based on: 1) low RF noise per QST tests. 2) cool case temperatures. 3) fixed 13.8 volt output (I didn't want a front panel voltage knob to get twisted with a 756PRO attached). 4) acousticly quiet, temperature controlled fan operation. 5) Heavy duty connection terminals on the rear.

Ok- If you could have the Astron RS-35M or the Astron SS-30M
for the same price, which would you choose? That's what i'm trying
to get at -- why choose a switching PS over a traditional one?
I understand the SS will run cooler, but what else?

> --
You might also want to look into Vapor Phase cooling.

The drawbacks to water cooling are the greater complexity of the system.

IF the tetrode is made for water cooling then the main items are
1. The pump
2. Piping
3. The water connections to the plate side needs to be through a coiled
and insulated tube. We used to use 20 feet on the inlet and on the outlet.
4. Pressure differential switch between the inlet and drain.
This has to allow for plugged situations in addition to assuring sufficient
flow.
5. Water reservoir of sufficient capacity.
6. Method for cooling the cooling water, whether a radiator, or
refrigeration system.
7. Sufficient quanity of "Distilled" water.
8. You will still most likely need to use forced air cooling on the tube
base.

NOTE...distilled water tends to be very corrosive when used with Brass and
Copper.

Conductivity of the distilled water needs to be monitored, or the water
needs to be changed often. If any of the system is exposed to freezing
temperatures then the system will need some sort of non conductive
antifreeze. Actually 200 silicon fluid with a viscosity of around 20 cs
would probably work quite well and not suffer from the freezing
problem...but man that stuff is expensive.

Now, *IF* the Tetrode is not already made to be used with water cooling, it
will either require modification, or the construction of a cooling collar(s)
that will give even flow around the circumference of the anode and
sufficient flow.

There were several articles, or a series some years back in QST (I believe)
that covered both Vapor phase cooling and converting axial cooled tubes to
water cooling. (seperate articles)

Both methods work very well and are silent. As the water resivor, pump, and cooling system can (and usually are) remote, they are silent and also do not drive you out of the shack in warm weather.

The vapor phase may be a bit more delicate to design by their nature, but with a good design they are, or can be, much simpler than the circulating water systems.

One added note...Although a well designed system is reliable, a failure can be both messy and expensive. Stop and think about what happens if a line fails. The system should shut off to protect the tube, but even the protective devices have been known to fail

We had a 3,000 gallon resivor and I've seen it *all* on the floor at one time.
If your system fails, where will the water go and will it cause any damage?. I'd guess the one time it cost us close to $100,000 in parts

73

Roger (K8RI) Spent 26 years working with and around liquid cooled RF systems and others more exotic.

11. Re: power supply question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-01 04:07:54 UTC
From: Bob Lewis <rlewis@staffnet.com>
Message-ID: <foT36.5110$jl6.18735@newsfeed.slurp.net>
Source record: 66736

The primary reason for a switching supply is size and weight. If you only want to use it for fixed operation and have plenty of room then I'd go for the traditional supply because you won't have to worry about RF noise. If you might want to transport the supply as in a portable operation then I'd go for the switching supply because of the lower weight and smaller size. If you go for a switching supply then you need to be careful to get one that is well shielded and won't cause RF noise in your receiver. That's the trade off; size/weight vs. potential RF noise. Performance wise they will be the same provided they are both of equal quality and properly designed. Cost wise they will be very close.

> Pointing it to an old power supply in the tower.. Not that old though..
> would moving the radio away from the equipment help?

Maybe and maybe not. Probably not, unless it is a big move.

With well designed radios and outside antennas you shouldn't hear the computers.

For instance, My HF rig is setting directly under a 19 inch monitor and directly over the computer (which has the cabinet removed.)
Directly to the left of the HF rig is another computer (bout 3 to 4 inches from the rig) and the monitor for that rig is adjacent to the one over the rig.

There is a third computer and monitor about two feet to my left. That computer also has the cabinet off.

All three are networked and the router sits adjacent to the computer that is just to the left of my HF rig. The ISDN router sits under the network router.

My Antenna tuner is to the right of the HF rig and the coax cables run together with the various lines from the computers. My VHF/UHF rig is adjacent and to the right of the antenna tunner and the spare HF rig is above the VHF/UHF rig and just to the right of the 19 inch monitor.

Oh...The henry 2K4 is immediately to the right of the UHF/VHF rig.

An HT setting on the desk will hear the computers.
The VHF/UHF rig which is connected to an outside antenna does not.
Running a full KW does not bother the computers.

I have taken no special precautions in either keeping the RF out of the computers, or the RF inside the computers from getting out (covers off the

two)

What I have found is that the modem I had prior to going with the ISDN connection was a really bad radiator where the HT was concerned and could be heard as much as 20 feet away. It was still not heard by any of the base station equipment.

Currently the station is not grounded except through the AC line.

That is due to a back hoe catching my ground system and pulling the whole thing out through the basement wall. At least they didn't get the rig, but they sure made a mess of the one part of the basement wall and cracked it almost to the foundation in one spot.

Unfortunately I could buy one whale of a *nice* station for what it's going to cost to repair that basement wall next spring.

Source record: 66740

I have a few articles I have collected and am now wanting some new and different stuff!!

1) Yaesu FT101EE + Speaker - rig seems to be in good condition. I got it from my father in law who never got past his tech license due to a slight hearing problem. I am listing this combination for $250. I have manual and mic for the rig.

2) Yaesu FV 101B - VFO.. Works very well. I have manual for this also. I am listing it for $175.

I would sell the above combination for $425 + shipping

3) I have a Yaesu 221R- 2 meter all mode . This is in grt operating condition. The cabinet has been repainted black but looks pretty good. This rig is a really good ssb rig. It 's out put is rated at 25 watts. I have the manual for this rig and microphone

4) HTX 10 mobile rig for 10 meters. This rig is exceptionally clean and very functional. Would make a nice bench rig with power supply for 10 meters, which has been exceptionally hot lately.. $80 + shipping.

Email if u are interested...

Bill

Hi and thanks for reading this posting. Get a great Christmas present for yourself! I have for sale a Very HEAVY DUTY 4 Element 10 Meter Beam. The Beam is made of aircraft aluminum. The elements are 1" and 7/8" which doesn't sag at all. The mast is 2" diameter and 16' long. All the the "U" clamps and hose clamps are all stainless hardware. The gamma tube is cooper, aluminum and polystyrene. It was built it to last. If you are looking for a 10 Meter Beam that will hold up to most all cimates, this is the one. This is "Home Made" following the ARRL Antenna book design but stronger. It was only out in the climate for 3 months and is "Like New". Only reason for selling is that I got a Tri-Bander and don't need this one. Will sell for $150.00 (the materials cost more than this price) + shipping from Idaho Falls, Idaho 83402. You can see pictures of the beam at: http://www.srv.net/~wa4vrv/beam.htm

Source record: 66743

I purchased the same supply (Astron SS30M) for my IC746. My decision was based on the size and weight as well as the requirement that it have
adequately quiet RF performance. I have not been disappointed. It is quiet and runs cool, which also means conservation of electrical energy, an important concern here in California today.

I would like to have small-range voltage adjustability, which this supply
does not have, so that it could be used more readily for battery-float service. While the supply documentation does not indicate whether it is or is not suitable for floating across a battery, my experiments have been successful. I ran it across a Group 27 deep cycle battery, and it didn't self-destruct. It charged the battery, and the current dropped off reasonably.

The Astron SS-30M is small and light and readily portable, which suits the Icom 746 well. I also operated it from a small generator - both with and without the deep cycle battery (Honda EX650), and it worked fine though the tests were brief. Running a 100 watt SSB rig from a small generator does not always work well - the varying load can modulate the Generator and drive it unstable - but the SS30M and Honda 650 combo worked fine. I can't say for sure if the SS30M helped here, as I didn't have other supplies to test, or perhaps the 650 is more resistant than the earlier Honda 500 I had trouble with years back.

If weight, size, generated heat and power consumption are not important then there may be little or no advantage to the SS30M.

And has anyone seen if it will have a transverter output (unlike the 821)????

Dino KL0S/4

24. Re: TUBE WATER COOLING??

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-01 17:05:23 UTC
From: ham_guy@webtv.net
Message-ID: <3223-3A50B8D3-39@storefull-136.iap.bryant.webtv.net>
Source record: 66749

At General Motors, Electronics division, we used a laser to cut through the resistors to adjust value on our ignition modules. The laser tube was water cooled. It was about 20 inches long, enclosed inside a rectangular plastic box.
Each end of the box had a hose attached (inlet / outlet). The hoses ran through a filter to a pump/tank device that held liquid that was called "heavy water." I believe it was H2O2. The tank held about 5 gallons. The electricians had to replace the laser tube occasionally as it burned out, but aside from losing some "heavy water," it seemed like a relatively simple task.

The laser beam was directed and switched by computer control to adjust the resistors to an assigned value. I remember one day, a lady operator put her chrome plated tweezers into the laser cabinet to move a part, not knowing the electrician had by-passed the interlock disconnect switch. The tweezers reflected the laser beam up, across her face as she looked into the box. It was something none of us will forget for awhile!

I believe the water cooling could be duplicated without too much trouble. I don't remember the suppler who sold us the equipment or supplies. Maybe someone else knows? My 2 cents worth.... 73 Johnny

CTCSS = Continous Tone Coded Squelch System

PL = Private Line (This is a Motorola trademark)

Both systems are the same, a system of sub-audible tones that open the
squelch on the target receiver.

To operate without this system, simply turn it off. To operate with
the system then the Transmitter and the Receiver must be set to the
same tone frequency.

One of the big points to remember on water cooling is to monitor the water. Depending on the high voltage you are using, the water resistance needs to be rather high. You can not use regular tap water. Best thing to do is to get distilled water.

You also need to know that the water will deteriorate in a rather short time. You will need to have some filters in the water system to keep the water pure. This way the resistance will stay high and not arc inside the tube.

Don't forget that you will need to have a pump to keep the water circulating. Need a flow switch to make sure the water doesn't stop moving. If it does, you need to shut the high voltage off right away. This prevents the tube from over heating.

Just having the filaments turned on will generate a good amount of heat. Then don't forget that you will need a heat exchanger to remove the heat from the water system. Generally this is vented to the outside. If you live in a cold climate, you will need to have a antifreeze heat exchanger. This will need a fan outside to blow air through the outside cooling coil.

Sure you still want to use a water cooled tube?

27. ICOM 745 Expert Help Please!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-01 17:59:29 UTC
From: Dennis Grindrod W1PPJ <w1ppj@snet.net>
Message-ID: <2B346.15084$OD.6164840@typhoon.snet.net>
Source record: 66752

Hello All,
Can you please help me with a problem.
I have a Icom IC-745 Transceiver that has developed a problem on the 10 meter band ONLY. Both transmit and receive modes on 10 meters the signal has what appears and sounds like an AC note on all the signals (both transmit and receive). I checked all the other bands and the rig is fine. I also checked the power supply on my other 745 and it works perfect. What ever the problem is it's only on 10 meters and common to both CW and SSB. Maybe this is a known problem and you can direct me as to what components might be bad and I can change them. I have the schematics and board layouts but have no clue as to where to start. It's strange that it's only is 10 meters. Sounds like a 120 Hrz. super-imposed on the cw and SSB signals in both the transmit and receive mode. I love these radios and would like to resolve this problem with all your help. Please advise and thank you. W1PPJ

I was told by Ten Tec that the specs were the same as the Pegasus except for the cpnventional front panel. You can go get the tech review from ARRL Web Site if you are a member. The specs are the same as a entry class HF radio except you have the DSP to change bandwiths so you don't need to buy optional filters. The DSP is in the IF stage so you shoudl have less AGC pumping. Whenever I see a TENTEC Review I find I have to find out is the guy is a FLAG WAVER or is he a regular guy who is giving a honest review of the radio

Yes,

It does sound neat. But I think the objections are valid. The cost is prohibitive--I think I heard 7 million just to Get it there)--due to the logistics of maintenance. Unless you are willing to let it operate temporarily, you have to commit to repeated trips to replace batteries and do routine maintenance. Then there is the control system that would be needed to keep it running here on earth. What happens if it hangs up? You can't just hop in the car and run up the mountain to turn it off. What if it refuses to respond to commands? What kind of interference would it cause--at least until the batteries died? It WOULD be nice, even as a temporary experiment, but I believe the logistics and costs wouldn't justify it.

Gordon,

The real question is:

Does a 10 lb package on the moon make more sense than a 1000 lb package in orbit if both cost the same in terms of dollars and in terms of the size of payload you have to launch to get it there ?

Bob

36. FS: Kenwood TS-940SAT HF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-01 20:27:30 UTC
From: Rick Riverman <rbriver@home.com>
Message-ID: <SK546.215885$U46.6584391@news1.sttls1.wa.home.com>
Source record: 66760

FS: Kenwood TS-940SAT HF Transceiver:

- Serial number: 9090002 (late model with all the mods)
- Built in automatic antenna tuner
- YK-88C-1 CW filter ($88.00 from International Radio)
- YG-455C-1 CW filter ($155.00 from International Radio)
- Full service manual
- Operation manual

* Continuous receive from 100KHz-30MHz
* 160 through 10 meters transmit LSB, USB, CW, AM, FSK
* Dual VFO with A/B split band operation
* 10 meter FM with offset capability for repeaters
* 100 watt output all bands
* Auto tune any band in less than 20 seconds
* 40 memory channels
* Digital clock and auto timer
* I/O for PSK31 (uses the phone patch ports)
* Friction adjust for main tuning dial
* Built in power supply
* Many more features...

This is arguably the finest radio ever built by Kenwood.
I don't know of anything better for CW operation. Signals are
crystal clear using the above 400 Hz filters. SSB bandwidth can
be easily shaped and notched to bring you only the signal you
are looking for. 10 meter FM works as easily as your mobile rig.

All for $850.00 + shipping from 97006 (approx 50 lbs.).

Thanks,
Rick

You get far more radio communication per kilogram out of a repeater in LEO
or near GSO, because the Moon is so much farther away and any particular
point on its surface has two-week outages in solar power. The engineering
problems are also significantly greater: the lunar surface is possibly
the most hostile environment in all of near-Earth space, because of those
long cold nights, and even with nuclear heat sources, the lifetime of
solar-powered surface electronics packages is much less than what we
expect of satellites. Finally, the transportation costs are much higher,
and rides there are scarce at any price.

Pure and simple, it's a lousy place to put a radio repeater for use by
Earth-surface hams. Which is what radio-amateur satellites are all about.

Great news -- the antenna works. Made my first (ever) CW contact on 40m today. I must say it is the most exciting thing to happen this year!! (given that the year is not even 1 day old). Made contact from Chicago to Georgia... its not amazing, but its enough to make my efforts worth wild -- and to increase my intrest in the hobby . I took the code test back in 1994, so my dits and dah's were probally a bit rusty.. (and i'm sure my nervousness didn't help much!)

Anyway, thanks for the the antenna tips!

For Auction on eBay.

Yaesu FT-1500M Two-Meter Mobile Transceiver.
The radio is like new with box and all of the contents freshly packaged.
This radio has very little use and has never been mounted in a vehicle.

Yup. Flag waving went out with Hammarlund and Hallicrafters. Its more
important to send our Social Security checks to Taiwon and China to get
that imperceptable paper statistic difference.

Watch out!!!!! Those Cadillac TEKTRONIX scopes do not use FORD parts.
TEKTRONIX will not provide parts that are proprietary for any scope
that is more than 7 years old (all the good deals)
I got burned with a 2445A.

Jeff, I've heard of this mod but one which I think has had more success is to merely shut rig off, solder a very heavy piece if braided ground strap between the final plate caps and a sturdy ground screw inside the finals cage. put it all together and plug 'er in. You'll likely notice right away that the 27 mHz band is about as quiet as you've ever heard it...guess it must be the effect of the braid grounding all that snap-crackle-and-pop. Seems to cut down that annoying skip too.

Hi all. I'm new in here, but am hoping someone may be able to point me in the right direction. My son has discovered an interest in amateur radios (having had one demonstrated to him) and I'm interested in helping him further that interest. He knows he has to study materials and take a test before he can become licensed and I know the hq's are located in Connecticut somewhere. Can someone tell me where to find the materials for him to study and which one to start him out on if there's more than one manual?

Thanks.

Meri

58. motorola PACER Q : what is CTCSS and "PL" ?

And in addition to that, both the uplink and downlink power would have to be 100 times stronger to combat the 20 dB extra path loss. In addition, the moon repeater would work only half of the time, unless it is nuclear powered.

Two satellites in lunar orbit would be much better, since batteries could supply power during new moon, thus 100 % usability would be possible.

However, the only advantage I can think of using the lunar surface or the lunar orbit is that it would be easy to aim your antenna visually:-).

M. Schneider <markinokla@juno.com> wrote:
>Too bad this is the kind of person boosting amsats.

It appears that there are a couple of people here who want to have
everything spoon-fed, in their own language even, and don't want to spend
any effort to get some information.

When they are presented with URLs or references to further reading they
just come back with their rantings and want you to answer in person to all
the questions that pop up in their mind. And usually they even act as
if they has been mistreated, just for having been sent away to read other
information (available abundantly on the web and in books).

I find *that* bad. It shows an attitude of not wanting to make any effort
and at the same time criticising others who don't want to spend effort
on you because of that.

Hi, thanks for reading this.

I've just purchased an Icom Delta 1A, in non-working condition. I think I know what the fault is (it's related to the real-time CPU and the set not switching on) but I'd like to hear from anyone who owns one about your experience of the set. Is it reliable, are there any known faults? I'm also looking for any mods. The only one I have found so far is a vague description of altering the radio's coverage-are there any more around? I would be very grateful to hear from anyone.

Many thanks,

You can go to several on line sites for practice testsl. One is qrz.com and the other is the ARRL. You might wanna go down to your local radio shack and get him a study manual for the technician test which is the first level. Pls, Pls, have him get started on the cw or morse code. Alot of people get satisfied working 2 meters and the world is much larger than that. The current 5 wpm requirement is very easy to attain. There are also soveral on line programs for studying code. I believe you would find qrz to be very satisifying in all areas. The link is QRZ.COM: Ham Radio Website. Just look over to the left column and u will c where u can link to tests. The site will also give u the dates and sites of testing across the US... I have a very good cw program I would be happy to mail u if you are interested. (at no cost) of course.

You need to get involved too for him to thoroughly enjoy it. I am 49 and have had my amateur liscense for a couple of years and cant get either of my boys 16 and 20 to get involved and mom sure doesn't want to. You would find ham radio to be very practical in your everyday life. Good luck and let me know if you want me to mail you the cw program

A friend of mine just got one. He had to return it due to FM not working. They got in back to him and it works fine. The performance is equal to the $ 700 radios but has the DSP included so you don't pay for the filters ($ 199 for icom 455 khz onesand $100 for 9 KHZ ones). If you want a do it all radio with no extras to buy (except the remote keypad) it is OK. It is hard to belive reviews on Ten Tec as many guys are FLAG WAVERer (not objective).
It has the same recive performance as the the TEN TEC PEGASUS (read QST review).I think they want $ 1200 not includeing postage and hand mic.
For $ 1245 you can get a ICOM 746 with a built in autotuner, 2 mtr and 6 mtr all mode at $ 100 watts and much better performance and free shipping and hand mick from www.kjielectronics.com

Nobody's mentioned it so far, so ...

The National Electrical Code is very specific about your questions, David. It requires you to bond ALL of the grounds together, preferably by exothermic welding, as Jim recommends. So you should connect your tower ground system to the ground for your electrical service panel also.

Take a look at the NEC. I forget the exact section numbers -- something like 251 and 810, I think. One is about grounding in general, and one is about Amateur Radio installations. I think you'll find that you comply much more fully than 99% of the other hams out there.

... Rich

In addition to the online sites, Radio Shack carries a series of books on licensing. He will probably be best off studying for the Technician license, which is the entry level license these days.Go to www.arrl.org and follow the links to clubs in your area. They will offer testing and possibly classes. And there may be hams there willing to be "Elmers". This is an older ham willing to share what they know with a newcomer. Good luck to your son!

You still don't get it, don't you?

Pointing to places where more information can be found *is* leading the
newcomer. It is only the newcomer who does not have an urge to read that
information or has no persistence in following the pointers who has a
problem.

Being a newcomer is no excuse for being lazy.

I am interested in an IC-2100. I was wondering if you could program the
display to (just) display an alpha code, in other words, instead of 146.850,
I can have it display "PEORIA".
Is that possible?

The oldest and best mod was to tighten all the loose screws that can
be found in the shiny aluminium cans inside. You see: To get the
rig *all the way* up to 28/29 mcs., they had to be loosened before
leaving the factory. To get the rig down to 27 mcs, all these
screws must be tightened up.

> high and not arc inside the tube.

Actually the filters have very little to do with the resistance staying high. They just keep the chunks out of the system.

The impurities that lower the resistivity (not resistance...they are different) are not affected by filters as they are in solution.

The impurities are mainly metallic ions from the system.

Low resistivity is a problem with leakage current rather then arcing and the resistivity of the water has nothing to do with arcing in the tube.

Arcing *may* be a problem between the plate and ground through the water lines, hence the need for coiling them to increase the length between the high voltage and ground. Normally the arc will occurr in the tubing itself rather than through the water.

Don't forget the filament cooling. commercial systems kill the filaments but leave the forced air on the base of the tube.

>

Even for a full KW you can use a 30-40 gallon resivor which will serve as a heat sink for up to a couple of hours of contesting. Maybe as much as 6 hours, or more.
It takes one calorie to heat one gram (one cc)of water one degree as I recall. 40 gallons heated from say 68 degrees to 180, or 190 is one whale of a lot of calories.

Typically with only a KW running at 50% duty cycle the water could be run through a radiator laying horizontal so the air could flow through it vertically and you'd probably not need a fan. A couple of high volumn, low RPM (big) fans would be quiet and the radiator could be right in the shack during the winter.

> Sure you still want to use a water cooled tube?
>
A well designed system is quiet and reliable.
Building one from scratch with the flow switch, (usually a pressure differential switch), an inexpensive pump, the extra tubing between the plate circuit and ground, the radiator, and resivor to serve as a heat sink can be a pretty good task, but not insurmountable.

Remember you are cooling a rather small device that is putting out relatively little power over time so capacity is "usually" not a problem. It doesn't take a lot of flow to cary away the heat from the plate dissapation.

As I recall we used only about 12 GPM to cool 20 and 30 KW units that ran 100% duty cycle.

I still like the vapor phase cooling myself.

That only takes a resivor, the evaporator, a condenser, and the interconnecting tubes. If properly constructed there are no moving parts.

Treated properly, most TEK scopes will outlast their owners.
Just look at all the old 545's at flea markets.
I would take the 7000 series scopes over any other model
available. Now, the 5000 series is another story.
Even Tektronix is not perfect, but they are better than anyone
else.

90. **NEED HELP ** INFO ON RUNNING HL-2200 WITH FT-990

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-02 23:35:02 UTC
From: dude1966@hotmail.com
Message-ID: <3a5285b5.4235002@news.gte.net>
Source record: 66665

Hello, Thanks to any radio techs out here that can help out. I have
a Yaesu ft-990 rig and a Heathkit HL-2200 amplifier (2, 3-500
tubes)
my question is that the 990 should not get any more than -4 volts
from the amp's ALC connection.. the amps manual list it will put out
as much as 60 vdc... The rig i have is not listed in the
amps service bulletins (made long after they stopped putting out
bulletins) but have a bulletin with similar case...heres the
bulletin..
++
April 6, 1984
HL-2200 Bulletin No:
2KW Linear Amplifier HL-2200-1

Interfacing The Linear To Kenwood Exciters

The ALC voltage to Kenwood transceivers and transmitters should not
exceed -8 volts. To ensure the proper voltage to the Kenwood, add:

An 8 volt zener diode [PN 56-621] across the ALC connector on
the
back
of the amplifier. Connect the banded end of the diode to the ground
lug.
++

should I try using a 4 volt zener diode for use with my yaesu ft-990?
or just forget using the ALC altogether ????????? thanks in advance
for all the give input.

Please read message below thanks and there is no RESERVE!

Here is the Item for sale has no RESERVE!

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1205456580

Title of item: Motorola Syntor X9000E w/siren package
Minimum bid: $275.00
Reserve price (if any): $0.00
Quantity: 1
Auction Ends on: Tuesday, Jan 09, 2001 at 15:27:29 PST

The Item number is: 1205456580

92. F.S. Icom 900A 2M & 440 Transceiver

ICOM 900A VHF-UHF mobile transceiver, complete with 144 & 440 Mhz
modules, front and rear controllers, DTMF microphone, CTCSS Tone Squelch
Option fiber optic cable, mounting brackets, power cords and manuals,
and extended transmit and receive, and cross-band repeat capabilities.
Excellent physical and electrical condition. $275 Alan, W3BV

Justin,

I would second the post(s) that have recommended used Tek scopes. They are available at Hamfests and on web auctions. I would stick with something common like a 7603 or a 7704. Normal amp plug in's are the 7A18 or 7A26. Normal time base plug in's are the 7B53 and 7B85. A scope with plugins will probably run you $150 on an auction and $100 at a Hamfest. If you get a dud plug in buy another one for $20 or $30. If the mainframe is shot buy another one for $40 or $50.

Second choice, also in the same price range would be a Tek 465A or 465B. If you go this route though make sure it works. Fixing a portable is not much fun and parts can be very hard to find.

Next up (or maybe first up ...) would be a DVM if you don't already have one. Again used bench gear is out there and it can be a very good deal. I'm kinda partial to Fluke. I think I would go for one of their $100 or so hand held DVM's new rather than a used one. That way you have at least one piece of gear that is in calibration and that you can trust to set the rest of the stuff up.

Assuming this is for ham radio there are a few more things to round out a bench. Which ones you get and when depends on money and what you are trying to do:

Frequency Counter - to set stuff like transmitters on frequency, lots of older ones at <$50 out there
Signal generator - to set up receivers, sky's the limit. Military versions of the HP 8640 go for $250+
Power supply - nice to have on a bench. Probably <$50 for a simple low current adjustable one used
Bird watt meter - every ham should have one. I'd either buy it face to face at a hamfest or buy it new.

Past that you get into stuff that is fairly project specific. You could easily argue that stuff like signal generators already take you into that area.

Hope this helps.

Bob

Its been a loooong time ago, but I had this happen also. There is
a trimmer that affects the segment containing 10 meters, actually
its something like 22-30 Mhz, and I resolved the problem with a
little tweak. Don't recall exactly what/where the trimmer was,
tho. If you'll tune down to where the band switches, it clears
up, right?
If that doesn't ring any sort of bell with you, let me know and
I'll dig out my manual and schematic and see if I put some notes
there.

Hello Ezat -- try these:
http://hfradio.org/wb8rcr/QSLMaker.html

http://www.qsl.net/vk4wss/software.htm

I have used MS Power Point.
Also used my 35mm camera to photograph a local interest site -- then use
Avery transparent labels for my call and a large Avery label on the back
for QSL info see:
http://qrz.com/database?callsign=ac6v

Good QSLing

Looking for a few good used Bird 43 slugs. Could use:

5E (5W, 400 - 1000 MHz)
10E (10W, 400 - 1000 MHz)
50C (50W, 100 - 250 MHz)
50D (50W, 200 - 500 MHz)
100C (100W, 100 - 250MHz)
100D (100W, 200 - 500 MHz)
1000H (1KW, 2 - 30 MHz)
2500H (2.5KW, 2 - 30 MHz)

And perhaps others if the price is right.

Could also use a Bird 43 case, like the CC-1

Contact via e-mail at:

kbeckman.spankme@wi.rr.com (Remove .spankme to respond)

Try WB8RCRs QSLmaker. You can get it at:

http://hfradio.org/wb8rcr/QSLMaker.html

It works pretty well, and it's free.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

110. FS: Kenwood TS-940SAT HF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-03 05:38:57 UTC
From: Rick Riverman <rbriver@home.com>
Message-ID: <RVy46.222722$U46.6808058@news1.sttls1.wa.home.com>
Source record: 66686

FS: Kenwood TS-940SAT HF Transceiver:

- Serial number: 9090002 (late model with all the mods)
- Built in automatic antenna tuner
- YK-88C-1 CW filter ($88.00 from InRad)
- YG-455C-1 CW filter ($155.00 from InRad)
- Full service manual
- Operation manual

* Continuous receive from 100KHz-30MHz
* 160 through 10 meters transmit LSB, USB, CW, AM, FSK
* Dual VFO with A/B split band operation
* 10 meter FM with offset capability for repeaters
* 100 watt output all bands
* Auto tune any band in less than 20 seconds
* 40 memory channels
* Digital clock and auto timer
* I/O for PSK31 (uses the phone patch ports)
* Friction adjust for main tuning dial
* Built in power supply
* Many more features...

This is arguably the finest radio ever built by Kenwood.
I don't know of anything better for CW operation. Signals are
crystal clear using the above 400 Hz filters. SSB bandwidth can
be easily shaped and notched to bring you only the signal you
are looking for. 10 meter FM works as easily as your mobile rig.

All for $850.00 + shipping from 97006 (approx 50 lbs.).

Thanks,
Rick

Source record: 66694

FOR SALE

Henry 3000D 13Mhz Commercial Linear Amplifier.
Complete with cabinet, blower, fillament xfmr, Bird 5KW bi-directional watt meter. Complete Meter and control Panel, Rebuilt 3CX3000A7 Triode and Maint and Operation Manual. (NOTE- NO PLATE SUPPLY WITH THIS UNIT) Requires heavy duty 6-7KV at, at least 1AMP 220VAC Primary. A PlateTransformer such as Peter Dahl manufactures would do very nicely with this unit. This unit will run 1500 Watts output Key Down forever, I bought it to build for my RTTY station but Career and Family have taken the front burner.

In addition I have a 50-300 PF 15KV Mil-Standard Motorized Vacuum Variable Cap and a Gold Plated motorized inter-roller band coil if your interested.

Please serious buyers only, this is a QRO Amp that requires Amateurs with plenty of knowledge and experience in the building and operation of High Power Linear Amplifiers. If you like to build and modify High Power Linears then this is one to take a good look at. This is not the same as your average amateur style amplifier, and as such is priced accordingly. If you have the bucks and are a serious buyer, I'm interested in hearing from you.

email for telephone contact and discussion.

Location Sacramento, CA

Regards,
Don W6PJJ

It is cold in Ohio, so I am cleaning the hamshack! I have several nice keyer paddles for sale.

1. Bencher BY-2 chrome base, very nice, with original box. $75 includes shipping in continental 48 states.

2. Bencher BY-2 black base, very nice, with original box. $65 includes shipping in continental 48 states.

3. Ham Key iambic paddle. One of red finger pieces has been repaired. Otherwise all is very nice. $60 includes shipping in continental 48 states.

4. Nye Viking keyer paddle. Good condition. $60 includes shipping in continental 48 states.

5. Vibroplex Vibro Keyer single lever paddle. Beige base. Has some wear marks on edge of base. Missing the top plastic decorative piece. Otherwise, works just fine. Serial #253091, 833 Broadway, NY. $55 includes shipping in continental 48 states.

Questions? Send me an email at k8mfo@aol.com

Thanks

Don K8MFO

126. AL-811 what is the max watts

128. Sangean ATS-818 Mods & Antenna Zapping Questions

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-03 17:41:41 UTC
From: mcotton@gte.net
Message-ID: <3a5363b6.9862708@news.gte.net>
Source record: 66603

After badly botchng the repair job to replace the static-zapped FET transistor in my old Radio Shack DX-390, I've relegated it to the scrapheap and bought a used Sangean version (ATS-818) on eBay.

Once I take delivery, I intend to:

1.) Locate diode D29 and snip it, thus performing the anti-muting modification as I understand it...Do I understand it correctly?

2.) Snip the leads to the tiny chirping tweeter next to the speaker to remove the chirping sound that annoys my wife when I'm tuning...

3.) Solder a lead to the circuitboard where the whip antenna makes contact, so that I can attach a longwire antenna I have running through my attic. Is this location on the circuitboard correct for using a longwire?

4.) Solder a lead somewhere inside to attach my groundwire that runs outside to a stake driven in the ground. Any recommendations exactly where inside this should be soldered?

5.) I would like to put some sort of protection in place to prevent the FET being blown out by another static zapping. I've seen some different ideas on this, but would like something really simple so I don't destroy this radio like I did the DX-398. I read one where it said to simply put a 10K resistor between the radio and the ground. Any ideas on this?

Any and all responses are appreciated.

Mark

130. Help - FT900 messed up band boundaries

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-03 20:01:55 UTC
From: Kenny Gillen <kenny.gillen@libertysurf.co.uk>
Message-ID: <978552126.21195.0.nnrp-07.d4e56f18@news.demon.co.uk>
Source record: 66606

Hi, All.

My FT-900AT has developed a strange problem. It used to let me
transmit in the range 3.5MHz - 3.8MHz (the UK 80m band) but
recently it has changed to not allow me to transmit between 3.5-3.75MHz.
The behaviour is the same as if I tried to transmit out of HAM band, ie.
the TX light goes red, but there is no power output, and a press of
the tuner button doesn't do anything.

The entire range 3.5 - 3.8 MHz is valid in the UK.

Have you seen this, or would you have any idea about how to
reset the bandplan data to the UK bandplan?

Any help would be greatly appreciated.

- Kenny MM0CXB.

Well, all kinds of guys will likely jump on me for saying this but I never connect the amps ALC to the rig. Never had any luck doing that, it always seemed to cut the rig's output way back...I just watch the amp's drive and plate current to avoid overdriving it.

First of all, where are you trying to play at?
if its 10/11 what you see is what you get.
the watts you are seeing are close to accurate.
Not a real powerhouse but it will do the job
SSB/CW it's a real performer.
cul Donnie

Source record: 66623

Hi all..
I've got an Icom 706 mkllg installed in my Landrover Disco..
There are 2 gutter mounts.. one so239 for vhf and the other 3/8" female for hf.. I have used the pro-am antennae which work well static, but obviously can't use them mobile on the thin gutter mount as they whip about too much..
Although they're supposed to be ok at 50-70mph(?)..
I'm thinking of having a bracket made up for the spare wheel nuts on the back door.. I know someone who might be able to help but ... one thing at a time..

Q1: What is the best Auto ATU for the job..? AT180/AH4 or others..?
Q2: Do I keep the pro-ams and spare wheel mount idea or try something new?
Q3: What HF mobile antenna do you/have you use/d? How do they perform...?

All I want to do really is use 20m mobile when there's no 2m/70cm activity..
I've been looking on websites and in mags but there's not a great deal of advice available..
I'd be grateful for a bit of advice if poss please..
Thanks..
Peter..

Source record: 66637

I think that a good bracket on the spare tire mount should support an
adequate antenna.

Remember that the laws of physics apply, and the bigger the antenna, the
more efficient. 20M is usually not regarded as being super-critical in
terms of antennas, unlike 75m.

The Hustlers that I use work fine, except on 75m. I like them because
none of the parts cost that much, so when I break something (usually by
doing something stupid like jeeping without taking off the resonator),
it is cheap to replace the broken part. The quick-disconnects are useful.

I noticed mine doing this one day when it was really quiet in the room. It was the internal blower turning on and off. Its a long skinny blower wheel that I can't even hear run but sometimes notice the click as it turns off or on. Does it when I'm just listening and no xmitting. Could be your click too.

A. McCann wrote in message <3A53461C.AC22F664@swbell.net>...

I have a Hw101 with the power supply and sb600 speaker all gone through by a local heathkit expert. Everything is up to par, with hand mic and all applicable cables. Had repainted in SB colors. Just looked better I thought. want 250.00.

ALinco DJV5T Dual band HT 2/440 and can be used a scanner too 70-900 mhz less cellular. About 6 mo old only perfect cond. Case, orig box and manual, 2 antennas , stock one and Diamond 17" one. charger. 200.00.
Pay pal preferred but will take Mo.

Looking for Dentron Equipment esp the bigger tuners. But what ever you have let me know. Also any higher power tuners except MFJ don't like that plastic junk.
OR a good dual band mobile rig , OR IC 900 with some modules.

165. Solar Energy DC/DC Converter? OFF The GRID

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-04 19:07:07 UTC
From: John Feist <aa6qn@pacbell.net>
Message-ID: <3A54C9DB.AFA379F8@pacbell.net>
Source record: 66641
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have built a 24vdc wind and solar alternative energy system in hopes of being grid independent here in San Diego. With the deregulation and the rising cost of electricity this has become primary goal for me.

Thinking that I could tap off the 24vdc battery bank for the 12vdc power needed to run my radios, tnc's and antenna controllers I was met with erratic charge controller problems, current loops through the rf cables and now have a separate 12vdc battery bank.

My current challenge is to charge the 12vdc battery bank from the 24vdc system. Taking this in mind I did search the web and found a DC Source Battery Charger on Majorpower.com site, BCD300-32-12 for $390. I did find some other various DC/DC converters as well but the cost are a little high also.

Does anyone else out there have a in-expensive solution to this design problem? I would like here from you.

Happy New Year, 73, John AA6QN

171. WTD: Coaxial TRANSFER switch, B&W or similar (MORE INFO THIS TIME)

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-04 20:35:17 UTC
From: k5dh@raytheon.com
Message-ID: <98556.30$j6.1868@dfw-service2.ext.raytheon.com>
Source record: 66647
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hello again...

I'm looking for a coaxial TRANSFER switch, the type used to either insert into a coaxial line or remove from a coaxial line an amplifier, antenna tuner, or other coax-fed device. This is NOT just a coax selector switch. It is a TRANSFER switch. There's a big difference. The switch must be able to handle at least 1 KW PEP.

Below is a diagram of how the switch I seek works. The verbal labels ("Exciter", "Antenna", etc) are only there to illustrate how the switch might be used, they're not marked that way on the actual switch. I intend to use it to bypass my antenna tuner.

(set font to COURIER NEW to view the diagram properly)

Position "1": (straight through)

```
Exciter >--------------< Antenna

Tuner Out >--------------< Tuner In
```

Position "2": (cross-connected)

```
Exciter >-----+ +-----< Antenna
\/
/\
Tuner Out >-----+ +-----< Tuner In
```

I know B&W made one, because I used to have one of theirs, and I'm sure there were others too. I need one with SO-239 connectors. I've heard that someone made coaxial relays to do this same thing, and one of those would work also.

Assuming that you have eliminated the antenna/xmission line as the culprit I would look at the antenna connector and its connections to the curcuit board in the rig, The antenna relay contacts (assuming it has a relay) etc.

178. FT90R vs TM-G707A

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-04 22:55:39 UTC
From: c5_vette@my-deja.com
Message-ID: <932v16$6e7$1@nnrp1.deja.com>
Source record: 66554

I am in the market for an inexpensive 440mhz/70cm mobile. Since dual banders are usually as cheap or cheaper than single band UHF radios I will probably just get a dual band radio.

I have narrowed my search to the Yaesu FT90R and the Kenwood TM-G707A. Both have small remote mount heads (the FT90R is tiny even with the head attached).

I looked at the reviews on eham.net . The TMG707A has 3 (all 5 stars), 21 (3.9 avg) for the FT90R.

I will use an external speaker with either, it will be mounted in the car and not used elsewhere. No packet.

I would like good 440mhz performance (of course). Nice things would be wide and narrow FM receive (to pick up TV UHF/VHF audio, etc), general out-of-band sensitivity, quick scanning, etc.

Which of these would be the best? The current price on the TMG707A is $70 less (which would cover the cost of the remote kit).

Any other models that would fit the bill that I should consider? I will be remote mounting the radio (under the seat or in the trunk) so that is another must have feature.

Thanks,
Dennis

Hi All,

I recently purchased a service manual for a Kenwood TS-820S from Steve
Cuilhe' - WA6GSD.
The manual was as advertised and Steve shipped quickly. I wouldn't hesitate
to buy from Steve
again in the future.

Thanks Steve!

CLIMBING BELT FOR SALE

I have a complete ready to use "medium" size (32 to 44) climbing belt with
tool pouch
for sale. It is used but in very good condition.

This is not the leather type which are no longer used for safety reasons.

Price: $65.00 PLUS shipping from 29609.

Many thanks for reading.

Neither one of these models can listen to both sides at once nor can they do dual in band receive. They are therefore useless and should not even be considered.

Yaesu FT-890 transceiver with the following features:

1.XF-110C 500 HZ CW filter installed.

2.Hand microphone with Heil HC-5 cartridge installed.

3.Three spare meter lamps.

4. Original manual and box.

I am the original owner and the radio is in excellent condition. On a scale of 1 to 10 it is a 9+. It has never been used mobile and has always been in a non-smoking environment. The radio was primarily used as a receiver and the finals have low operating hours.

$575.00 plus shipping

Source record: 66566

I'm looking for a mobile rig (to replace my FT900/AT) as my primary rig in the car, for HF mobiling and some casual VHF/UHF work. Does anyone have any comments on using the Icom rig with CW (my predominant mode)? I'm especially curious about how well the filter works. Can the SSB filter be installed as well as the CW filter in the same radio?

Thanks in advance!

Dennis KD1JT

Odd that you can't hear the blower, mine isn't loud but there's no way to mistake it, and it too runs occasionally even when just sitting there receiving, I monitor Gander Centre controlling overseas travelling aircraft all the time that I'm in the Rdo Rm here...BTW, my 'S' meter is very 'stingy', anyone else notice this?...great rig otherwise...can likely be adjusted but I don't have a service manual...

I agree...I used to use an amp all the time but I've come to realize that it's not needed (on the ham bands at least) if you're operating it on 27 mHz you might do as one chap did and run one amp (SB-200) into another!!...said that he had a huge amount of power output (mind you, he didn't say for how long).

Hey John
Auto Zone has some 300VA inverters that run off of 12-24VDC and put out
120VAC. cost $60.00. 500VA is also available but the price jumps .
Of course that rating is into a resistive load. So the VA rating would
go down on most electronics unless they use a choke filter input.
I've run off of a 60AH gel cell at 12 volts but had to charge it
in the car while going to work. It's hot in the summer without a fan.
Good luck

194. FT-90R DISPLAY ISSUE

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-05 04:13:38 UTC
From: Terry Berman <tsberman@mindspring.com>
Message-ID: <3A5549F1.20006A37@mindspring.com>
Source record: 66570

I have an FT-90R mounted in my truck. Now that it is cold the radio is subjected to sub freezing temps overnight. When I turn the radio on in the morning the display remains blank until the radio warms up and the inside temp is cozy. This can take anywhere from 15 - 30 mins.

Is this behavior to be expected for this type of display or should I complain to Yaesu ?

Thanks,

Terry, AB4UM

Terry,

I'd say that this behavior is pretty typical of the
liquid-crystal (LCD) type of displays.They don't like
extreme heat/cold. They have a definite operating
range, temperature wise.

Somebody here on r.r.a.e did a nice piece on lcd's
recently, but I can't remember who...

Oh, well, the good news is that the messed up display
is only temporary, and will not be permanent!

GE Monogram SP2550 VHF ex CSX radio with battery and charger $100.00
GE NPC200 UHF 16 channel scan with battery and rapid charger. New Uniden case. Radio works and looks new. $150.00
Vertex VX500 UHF 32 channel scan with battery and charger. $185.00
GE Master 2 UHF 75 watt. with pre-amp no accessories. No Icoms $75.00
GE Master 2 UHF 40 watt repeater in a Desk mate case with GE controller. No duplexers. I will add a UHF Master 2 75 watt for parts with the station that way you can make it a 75 watt with a pre-amp. $650.00
Motorola MX300s software adapter for the 1801 suitcase programmer. part number RTL5805C. $250.00
GE Master exec 2 Mobile repeater. VHF radio with a UHF receive section. with your choice of a Master 2 or a delta cable. $25.00 I have several of these.
GE Voice guard 9600 series encryption boxes. $20.00 I have several of these.
Motorola Micor VHF 110 watt mobile. drawer only. make a repeater. $25.00 ea.
GE Mobile Vehicle charger. Turns the MP-A, MPD, MTL, and TPX into a mobile radio and charges the battery. Comes with the mic, speaker and wiring harness. this is my personal setup so I know it works. Price with one of the above radio's $100.00 if purchased separately $125.00
GE MP-A, MTL, MPD, and TPX speaker Mic's new in the box with all paperwork. $35.00. I have 2 of these. I also have 1 used Public safety speaker mic for $35.00
Marconi UHF portable HT 16 channel. Looks like a standard. I powered up with a power supply and the thing works and has good sensitivity. No charger so I do not know about the battery. about an 8.5 $75.00
My terms
Shipping is the responsibility of the buyer on all Items. All Items sold as is but Portable radio's will not be DOA. I will not cover return shipping but will pay to ship a replacement if I have one. I can have the above radio's programmed ask about price. Trades welcome just ask.
Wanted Items
4EX22A10 mini e-prom programmer.
TQ3330 Delta ranger interface.
TQ2310 suitcase programmer if I can trade above items for it.
Dual band mobile ham radio's.
Cash also works

Hi and thanks for reading this posting. Get a great Christmas present for yourself! I have for sale a Very HEAVY DUTY 4 Element 10 Meter Beam. The Beam is made of aircraft aluminum. The elements are 1" and 7/8" which doesn't sag at all. The mast is 2" diameter and 16' long. All the the "U" clamps and hose clamps are all stainless hardware. The gamma tube is cooper, aluminum and polystyrene. It was built it to last. If you are looking for a 10 Meter Beam that will hold up to most all cimates, this is the one. This is "Home Made" following the ARRL Antenna book design but stronger. It was only out in the climate for 3 months and is "Like New". Only reason for selling is that I got a Tri-Bander and don't need this one. Will sell for $150.00 (the materials cost more than this price) + shipping from Idaho Falls, Idaho 83402. You can see pictures of the beam at: http://www.srv.net/~wa4vrv/beam.htm

I pull the head off my Ft100 over nite so I can get on the radio right away
when in the mobile. In Wisconsin we have the same problem with the
displays. I have a leather case used for holding car stereo face plates
that I put on it if I'm only going to be out for a few hours.(I have the
extention kit and mount) Seems to help insulate it and keep it from
blanking out.

This is an exceptionally clean R-390A in original condition. It has never been modified and is in excellent condition mechanically and electrically. The gear train looks completely clean and the VFO endpoints are linear within 300 cycles. I retubed it and performed a complete alignment a little over a year ago. It has not seen much use since then, but I just checked it out and it is working flawlessly. This Radio was built by Amelco under contract 35064-PC-62. The serial number is 2204. It is very clean on the inside, and is complete with top and bottom cover.

Date: 2001-01-05 16:54:49 UTC
From: Rex Helfant <k2am@earthlink.net>
Message-ID: <t%m56.7154$1G4.321693@newsread2.prod.itd.earthlink.net>
Source record: 66591
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Yaesu FT-890 transceiver with the following features:

1.XF-110C 500 HZ CW filter installed.

2.Hand microphone with Heil HC-5 cartridge installed.

3.Three spare meter lamps.

4.Original manual and box.

5. Power cord.

Please note, this radio comes with only the items listed above. IT DOES NOT HAVE A TUNER.

I am the original owner and the radio is in excellent condition. On a scale of 1 to 10 it is a 9+. It has never been used mobile and has always been in a non-smoking environment. The radio was primarily used as a receiver and the finals have low operating hours.

$575.00 plus shipping

Thanks,

Rex,

Maybe his fan is dead and he is hearing the blower clicking in a death throw or the relay trying to turn it on? Just a shot in the dark. You are right, you can hear the blower, it startled me the first few times as in "what the hell is that!!".

Yes Gord, my meter is also stingy. If you hit me at 10 over you are pumping an enormous signal. OTOH a "s-2" is good copy on a 990.

Very happy with my 990.

I have the -g version now, and have the 350 Hz filter in it. Works well for CW as well as the digital modes. I think 350 is better than either 500 or 250 for CW.

I previously had the mk2 with both the .350 and the 1.9 filters and the optional DSP. I thought the SSB filter was not useful - the "shift" and DSP would do whatever I needed on SSB.

So - you might want to hold off on getting the 1.9 filter and make sure you have problems that the standard bandwidth and DSP can't solve before adding the 1.9

Thanks, Jerry. No unfavorable reports yet. I also thought about the 350hz filter. I used to run a TS520SE with an IRC 400hz filter, and liked it better than others I heard with a standard Kenwood 500hz. I definitely don't care much for 250hz filters for general use.

I'll take your advice on the SSB filter, too. My FT900/AT has no SSB filter (other than the stock one) but has notch and shift (but no DSP) and it's fine for my purposes. I have less than 1% of my contacts in any mode other than CW, so maybe I'll save few bucks. I was thinking in terms of "sale-ability" later on. Nah, hams never sell their radios ... grin!

Thanks again.

I have a TMG707E (no airband as standard - but that can be done with a mod)
and I use it in my car for the "drive time" to / from work. works well and I
am very
satisfied with it.
Yes it has failings (very very strong signals clobber it but then they
clobber every
other rig as well) it can not do dual RX but that is not one of my
interests.....
I find dual receive very hard to follow when driving (too distracting)
The price I paid in the UK was 259UKP and represented a good buy.
The rig is I believe good Value for your Buck.

Thanks for the reply, Martin.

Does it receive out of band OK (like FM wide TV audio,etc) ? How about the scanning speed? I am seen complaints that the Kenwood scan was real slow.

Dennis,

I don't think you will go wrong with the MKIIG. I have an original 706
and recently purchased a G model. I love 'em both. I have no real
complaints except for the squelch which, IMO, hasn't enough hysterisis,
or "delay". But that is a very minor issue. Go with the MKIIG--I do
not think you will go wrong.

Source record: 66461

Group;

I just bought a Kenwood TS120S, which came w/o a manual.. I've found a source for a manual and have ordered it, but while I'm waiting for it to arrive, I wonder: How many amps does the unit require from a power supply? Also the unit came with a Kenwood AT120 antenna tuner.. For which the vendor of the radio manual, does not stock a manual for. Does anyone have the manual for the AT120 tuner that they could copy/fax to me? Glad to pay reasonable copy/fax fees..

Thanks in advance;

Message-ID: <935tqilns1@flood.xnet.com>
Source record: 66465

Looking for some help with a Vanco SWR-2 meter. I suspect
that its 1.7 - 30 Mhz, but i'm not positive. The SWR-3 product
seems to be. I'm looking for some help with the operation of
this little meter in conjunction with a QRP HF rig. Stuck inline
between the radio and the tuner... First switch set to 10W FWD,
the second switch set to SWR ... but there is a knob which is
labeled "set".... there's where i'm confused. Turning this knob
gives huge variances in the SWR reading.... from one end of the
meter to the other, depending where the knob is. How can I
determine (1) is this SWR meter actually for 1.7-30Mhz, and
(2) what's the deal with the "set" knob? Thanks!

Hi All,
Well i am reading all kind of things about AO-40 lately.
It is a LADA ,IT cost too much,It doesnot work well....will never do!!!!!
But i wonder what is THE Radio Amateur in her first means,
Experiment ,communication in all conditions, speak around the world all
friends.

I dont like what i read on the NEWSGROOPS AND ON PACKET/RF ,when i think
about some Ham Radio operator that are $$$$$ for some equipments , and AO-40
could join the different CLASS of Operator around the world too talk to each
other some would think about it and most WHY the join this great
Hobby!!!!!!!

I am not a graet station,during sumer i go on mountain ,install the long
wire talk to friends not so far but for the FUN...

AO-40 is not the one too have problem,and other will come, we are too much
use to perfection !!!!!!!!!!

Hello all,

I've got a very good condition Ranger 2950 with all the mods, bells and whistles.. This radio will do 10 meters AND CB.. Awesome rig, just don't need it now that I have a 706. I'm looking for an HF Outbacker antenna that will handle 6-80 meters or thereabouts.. Let me know what you have and what it would take to make this deal happen.

Thanks and Happy Holidays,
Paul Jordan

From: Steve Woodruff <sjwoodr.nospam@nospam.email.com>
Message-ID: <93652t$ou6$1@flood.xnet.com>
Source record: 66469

My father is looking for a nice QRP CW-only rig. The only catch is that he'd prefer a digital readout. The only one i've seen on the market (after only a little research) seems to be the Elecraft K1.

I checked eham.net's reviews and they only review the K2 -- not the K1. Does anyone have any experience with this kit? Thats the other thing... Its a kit and he's not a "master kit builder" so i'm looking for some estimates of the level of difficulty. Of course the website says anyone could build it, but that's usually not the case.

X-Newsreader: NN version 6.5.1 (NOV)

In rec.radio.amateur.equipment you write:

>between the radio and the tuner... First switch set to 10W FWD,
>the second switch set to SWR ... but there is a knob which is
>labeled "set".... there's where i'm confused. Turning this knob

Set is used to get full scale reading on the Forward meter, then
the Reverse meter should give you an SWR reading. If the Forward
meter is not "set" to full scale, your reading on the SWR reverse
side will not be accurate. I don't know where you'll get the
wattmeter reading at that, never had the vanco meter, not a big
brand :-) .

>gives huge variances in the SWR reading.... from one end of the
>meter to the other, depending where the knob is. How can I

This is how it should be, as explained.

>determine (1) is this SWR meter actually for 1.7-30Mhz, and

Don't know how you'd figure this, but I would expect any meter to cover at least to 30 MHz. It could be, I suppose, a VHF version, then it would not be accurate down in HF. You need to ask someone who has the specs.

Good luck.

Clark

Dave,

From the manual:

TS-120s, Rx 0.7A @ 13.8 vdc: Tx 18A @ 13.8 vdc

For what its worth, the matching PS-30 is rated at
20A @ 13.8 vdc with a 50% duty cycle and 15A at 100% duty cycle.

I have used the PS-30 with my TS-120s but found a Astron 35A
unit to be better suited for my use. Most any regulated PS
capable
of 20 amps continuous will do.

Any questions? I have the manual.

Steve,

Not familiar with your particular meter,
but in general, most of these meters have
a forward and reverse switch (Sometimes labeled
as Forward and SWR.)

What you need to do is set the switch in the 10W FWD
position and key the rig. Then use the SET knob to bring
the needle to the maximum reading position, normally
all the way to the right. Usually there is some kind of indicator
on the meter face that indicates maximum. Then, switch from
10W FWD to SWR with the rig still keyed. This should give
you an SWR reading.

Another neat thing to do is to try this into a known load,
preferably
a 50 ohm dummy load. That way you can tell right away if the
reading indicated with the switch in the SWR position is any
where
near correct. Into the 50 ohm load the SWR should be at or near
1:1.

HTH... Questions? I'm at WG7X@arrl.net

73 Gary, WG7X

Thanks for the info. This model has two switches:

1st switch: 10W FWD (top) / REF 100W (bottom)
2nd switch: SWR (top) / POWER (bottom)

So the "FWD" and "SWR" settings are on different switches.
Any ideas?

thanks!

There's just an HTML tag without the matching "end" tag. Netscape thinks that if you have a minor goof in the HTML, then you should not see ANY of the HTML. IE is much more forgiving, as are most other browsers.

Try pulling up the "source" window in Netscape and you'll see it's there, just not displayed.

250. FS: Kenwood TS-940SAT HF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-06 05:20:05 UTC
From: Rick Riverman <rbriver@home.com>
Message-ID: <9Wx56.234932$U46.7279839@news1.sttls1.wa.home.com>
Source record: 66476

FS: Kenwood TS-940SAT HF Transceiver:

- Serial number: 9090002 (late model with all the mods)
- Built in automatic antenna tuner
- YK-88C-1 CW filter ($88.00 from InRad)
- YG-455C-1 CW filter ($155.00 from InRad)
- Full service manual
- Operation manual

* Continuous receive from 100KHz-30MHz
* 160 through 10 meters transmit LSB, USB, CW, AM, FSK
* Dual VFO with A/B split band operation
* 10 meter FM with offset capability for repeaters
* 100 watt output all bands
* Auto tune any band in less than 20 seconds
* 40 memory channels
* Digital clock and auto timer
* I/O for PSK31 (uses the phone patch ports)
* Friction adjust for main tuning dial
* Built in power supply
* Many more features...

This is arguably the finest radio ever built by Kenwood.
I don't know of anything better for CW operation. Signals are
crystal clear using the above 400 Hz filters. SSB bandwidth can
be easily shaped and notched to bring you only the signal you
are looking for. 10 meter FM works as easily as your mobile rig.

All for $850.00 + shipping from 97006 (approx 50 lbs.).

Thanks,
Rick

Hello Ham Operators,

i am looking for an adress or homepage of a Hamradio Equipment Dealer,
who can exprot radios to Germany.
Can anybody give me some help in finding dealers?
Prefered in Ohio, but any other state is also OK, if the price is right.

Chris, DL6RDM

His name is Gervais, he is from Canada (Quebec). if one believes the message headers.

Don't you suppose his primary language is French, and he is bravely posting in English for heavens sake?

He sounds like an enthusiastic ham with a good attitude. It seems less and less frequent that someone uses the word "fun" in describing our service/hobby.

In my best (babelfish) French:

Les meilleurs voeux Gervais. J'espï¿½re que nous pouvons parler bientï¿½t.
Respects, Don

Hi Steve...

Well, I believe that to read power, switch number 1
can be in either the ten watt or 100 watt position
depending on your transmitter output.

Switch number one would then be used to read
power out in the bottom (power) position, and
SWR in the top position.

You've got a good point about the switches.
would seem that the functions of the forward
and reverse are backwards.

Try this:

Switch #1 10W FWD
Switch # 2 Power

Key transmitter and adjust set knob for
maximum deflection.

Unkey transmitter

Switch #1 10w FWD
Swtich #2 SWR

Key transmitter and see if a reasonable
SWR reading is presented.

I'm guessing that there may be another
setting that ties the SWR/REF and FWD/POWER
positions together.

Nothing to lose by trying a few different combinations.

Again, this is made a little easier if you have a known
good 50 ohm load. For QRP use, Radio Shack has
a CB dummy load that will do the trick for a low price.

Let us know how you make out.

Gary, WG7X

Hmm... the needle did't budge in that configuration (below). It
almost seems flaky... like it will suddenly surge up to a reading
after some time... (and i don't fault the radio for this behavior).
Various combinations of the switches do give SWR readings...
but usually well above 3:1. I'm not convinced my 40m dipole
is that crappy, even in tight corridors.

I hear what you're saying re: the dummy load. I'm actually looking
at the MFJ 949E tuner which apparently has the dummy built in,
as well as the SWR meter. The reviews on eham.net seem to be
pretty good. Anyway, tnx for the tips. I'll keep trying various
settings.

I read your posts and see where you may have been confused but regardless of meter set up, this is the basics for most of the ones I've seen. Pretty straight forward.

When reading SWR, you first put the switch whichever one it is, set to SWR. The other switch Fwd/Ref is set to Forward. Key the transmitter, adjust the knob till your needle goes to what should appear as a red line or set/calibrate (cal) mark on (usually) extreme right side of meter. Unkey radio, switch the Fwd/Ref switch to Ref and read the SWR on whichever part of the meter is labeled for it. Unkey radio when done.

For Power, you set the Meter to Power, and the Level switch to 10 W or 100 W whichever you feel will handle your output. If unsure of Output, set to highest first, then look at the meter. Even in the 100 W mode, it'll give you some indication of 10 W or less to show you if it's safe to use the lower reading. Then assuming it is safe, switch to it the 10 W setting for a more accurate reading.

If you are using the meter for a Field Strength reading to see if antenna is radiating, then set it as follows: SWR - FORWARD position, knob set to full sensitivity, or where the meter would peg if hooked to the radio. Then use an external antenna on the meter usually, marked FS. A small telescoping antenna is usually supplied for this purpose. Then you do a circular pattern around your property or radio (i.e.: Walkie Talkie) to check the pattern. The rises and falls will show where the energy is being transmitted the most. You can get a rough idea, BUT it can sometimes be confusing as well. In professional cases, there is a special way to do this which produces a graph, and is basically the same method used to determine antenna patterns in design and production. As you may well imagine, more sophisticated (expensive) equipment is used in most of those cases.

Few of the many meters that I've seen, have an adjustment to power other than a switched position for levels (i.e.: 10/100 or 30/300, etc.). I have seen them, but few.
Most of the cheaper meters, the adjustment is only for the SWR settings to get the "Forward" setting established.

Hope this helps!

Hi Ian,

I just recieved one as a birthday present. I purchased a mobile 10m antenna and put it ont he air today. First contact was a station outside of Hamburg, Germany. I was surprised....

I am not crazy about the tuning...you can use a rotating knob or the up/down buttons on the mike.....but changing steps is rather cumbersome....the scan works but in my opinion is too slow for serious band searching. Other than that I am happu with it....though I would probably not have bought it for myself.

Gee, is this a new program of some kind? I'm confused about the VE
reference; it hasn't been possible to get a license from anyone but a VE
for more than 17 years. Are you new?

> AOHF ~ assholes on H.F.

Just a wild guess, but I'll bet you can't get on.

Found this post in another NG. As hams we often operate Transmitters which could draw 8-15 amps (or more..) under intermittent duty cycles. This faq (see links at end) are an excellent resource on the proper care of auto and truck batteries and charging systems.

------------ cut ------------

The latest revision, 3.0 dated January 1, 2001, of the Car Battery FAQ has just been posted. It covers the following questions:

1. WHAT IS THE BOTTOM LINE?
2. WHY BOTHER?
3. HOW DO I PERFORM PREVENTATIVE MAINTENANCE?
4. HOW DO I TEST A BATTERY?
5. HOW DO I KNOW IF THE CHARGING SYSTEM IS OK?
6. HOW DO I JUMP START MY CAR?
7. WHAT DO I LOOK FOR IN BUYING A NEW BATTERY?
8. HOW DO I INSTALL A NEW BATTERY?
9. HOW DO I RECHARGE MY BATTERY?
10. WHAT IS PARASITIC LOAD?
11. HOW CAN I INCREASE THE LIFE OF MY BATTERY?
12. WHAT ARE THE MOST COMMON CAUSES OF PREMATURE BATTERY FAILURES?
13. HOW CAN I STORE BATTERIES?
14. WHAT ARE THE MYTHS ABOUT BATTERIES?
15. WHERE CAN I FIND MORE INFO ON BATTERIES?

If you would like a free copy of the Car Battery FAQ, you can find it at http://nyquist.ee.ualberta.ca/~schmaus/batfaq.html

If you would like the latest Deep Cycle Battery FAQ, it is posted at http://nyquist.ee.ualberta.ca/~schmaus/dcbat.html

Glenn, I'll bet that you've hit it!...never thought of that...I've been around for a lot of years and I'm quite familiar with how signals should sound on various bands etc and there's no doubt that my S meter is reading low, as you say, a signal showing 10 over 9 is a humungeous signal indeed (on this rig I mean). I don't think that I've 'ever' seen mine above '10 over' anywhere. I'm sure that there's an adjustment and if you ever find out where it is pls let me know...I don't mind getting in there with tools...cheers, enjoy your great radio, I do!...

This radio is a dual-band (2m/440) mobile radio capible of outputting 50w on 2 and 45 on 440. Unfortunatly, I have been unable to find any real information online, even the heath collector sites skip over it. I believe it is fairly new (1988+). Perhaps, being one of the latter heath models, it is actually an exact clone of perhaps a Yaesu radio? Any information on this radio would be extreamly helpful, and I am looking for a service manual for it. Please respond direct mail.

I have an opportunity to get 5 to 6 MT500's some banged up some pretty good. Complete with charger and some carring cases and speaker mikes. I don't know weather they are operational or not. They appear to be on about 460 MHZ. Need to know some kind of value for these and if batteries are available for them and how much they cost.

Any help appreciated.

Please respond directly as well as group if possible.

Thanks,
Alex

From: Markus Lenggenhager <hb9brj@nospam.gmx.ch>
Message-ID: <939nfq$5a6$1@news1.sunrise.ch>
Source record: 66525

Hi guys

Decided to buy the FT-990 service manual "Technical Supplement" including
the 3 extender boards some time ago. Here is the RF AGC & S-meter
calibration procedure (copied word by word, nothing omitted, nothing added):

- connect the DC voltmeter to TP1001 on the RF unit
- inject 100dBu at 14.200MHz from the RF signal generator to the ANT jack,
and adjust VR1011 on the RF unit for 5.5 +/- 0.1 V DC
- adjust VR2006 on the top edge of the IF unit for S-9+60dB on the S-meter

Hope this helps!

73, Markus HB9BRJ

Hi and thanks for reading this posting. Get a great Christmas present for yourself! I have for sale a Very HEAVY DUTY 4 Element 10 Meter Beam. The Beam is made of aircraft aluminum. The elements are 1" and 7/8" which doesn't sag at all. The mast is 2" diameter and 16' long. All the the "U" clamps and hose clamps are all stainless hardware. The gamma tube is cooper, aluminum and polystyrene. It was built it to last. If you are looking for a 10 Meter Beam that will hold up to most all cimates, this is the one. This is "Home Made" following the ARRL Antenna book design but stronger. It was only out in the climate for 3 months and is "Like New". Only reason for selling is that I got a Tri-Bander and don't need this one. Will sell for $150.00 (the materials cost more than this price) + shipping from Idaho Falls, Idaho 83402. You can see pictures of the beam at: http://www.srv.net/~wa4vrv/beam.htm

Hi Steve.

Well it could very well be bad,
that's why I keep mentioning
the known load. (AKA Dummy)!

Personally, I have two Bird meters
a Kenwood SWR/Power meter, and
a cheapie Rat shack for the mobile.

A ham can never have too many
test meters/tools/equipment!

HI!

Seriously though... Good luck with
that and keep up the good effort!

i think what he is refering to is that as of jan 1 the arrl has allowed VEs
to increase there testing fees to $10 up from the $6.75 or what ever it was
the last time i tested to cover there costs and stuff your NOT buying a
license at all just helping the VEs with the costs

Hello to all.

I've just acquired a FT-290RII that is in sad need of a major re-build.

This will be my 2m uplink for RS13 if I can revive the rig :)

The previous owner anointed the rig with a golden screw driver and now I
have a weekend project ahead of me. :)

Anyone with a schematic for this model who wishes to share his good fortune
??

I will be happy to pay for photocopy fees and shipping to Canada.

Many thanks and 73.

Don't waste the money. That has been done in the past - and, in many instances, it has been uncovered. The problem then is that the FCC wants all the folks who tested before those 'questionable' VEs to take the exam again - this time in front of an FCC examiner. Failure to do so results in revocation of the license (and you don't get the money back!). Should this happen in my city (Rochester, NY), that means a trip to the FCC in Buffalo - 60 miles away. In many cases, someone is going to have to travel a lot further. Not pleasant.

73 from Rochester, NY
Jim

Steve,

I have a Vanco here at my QTH. This one is the SWR-2. Left side - transmitter input, right side - antenna. Two switches on left. First one marked - TOP > 10W FWD, BOTTOM > REF 100W. Second one marked - TOP > SWR, BOTTOM > POWER.

To read SWR - Must first reference point as an SWR meter is a bridge like a wheatstone bridge. It must have a reference point. Place left switch in the top or FWD position. Place right SW in the top or SWR position. Use either the tune or CW position of the radio and key up. Using the knob on right end labeled SET & FS Adj, set the needle deflection to the set mark or full scale. (Make sure the little external antenna is REMOVED. Field strength input will mess you up.

Unkey the radio. Move the left switch to the bottom or REF position. Key the radio once more. Read the SWR ratio directly off the meter.

SWR only works when a constant signal, i.e., carrier of constant value is used.
By the way - This meter will give reasonable results up to 2 meters.
Bob

Steve

Another item - If you change power level, the SWR reading changes also.
More power than when set - higher SWR reading, lower power - the reverse.

Now why would I go and PAY for a license when I got my license, AND upgrades for free.. Oh, sorry, I did have to earn them with a little studying and such.. My club offers testing free.. No money exchanges hands.. And I can now talk world-wide on the Extra bands..

Just quit tryin to cheat the system, sit down with the manuals and get studying.. And if you want to take a test for free.. First Saturday of the month, Geo-Physics Institute, UAF, Fairbanks, Alaska.

Does anyone know if there's a keypad microphone for the old ICOM 706's?? I've just installed one I bought online and noticed there's no keypad. I use 2 meters a lot for autopatch and it would sure be nice to find a mic that works for it. If there is a mic, is there any radio mods that need to happen to make it work?? Any help will be greatly appreciated.

KENWOOD files remarks with the FCC, calling for elimination of all code testing.
NO CW TEST means CB. This PROVES that 1) Kenwood is just a bunch of CBers; 2) Kenwood will trash ham radio into CB to ensure their income.

KENWOOD lives as CBers, so let them DIE as CBers.

BOYCOTT KENWOOD!

Source record: 66356

RX: 108-174, 300-470 MHz
TX: 137-174, 410-470 MHz (MARS/CAP Modified)
280 Channels (180 if using the alphanumeric channel naming function)
Built-In Duplexer, Packet Ready
Cross Band Repeat
V/U, V/V, U/U
5,10,35/50 Watts Out

What You Will Get:

TM-V7 Radio + Microphone
Instruction Manual
Mobile Bracket
Power Cable
DFK-4C 13' Detachable Display Front Panel Kit
PG-4S Computer Programming Cable + Software
Comet B-10NMO Dual Band Mobile Antenna
NMO Magnet Antenna Mount

What's Missing:

Mic Hang-Up Hook

Condition:

This radio is in great condition. It has spent about half of the time mobile,

the other half in the shack. Transmitted very little, maybe 2-3% of it's
total life. Two flaws that I want you to know about: #1) Very small inner
chip in the lower part of the screen, however you really have to look close to

see it, as it's not even over the viewing area of the screen. #2) One of the

vertical lines in the LCD isn't working for whatever reason, could be
temporary. It's located over the middle of the last digit of the VHF display,

so it does not impact on seeing any of the settings.

Why am I selling this? Just to help pay for other radio projects!
There is nothing functionally wrong with the unit that I'm aware of.

The first $450 buys it, shipping to the 48 states included.
I'll either take a money order or PayPal.

Photos available upon request, please e-mail any questions.

Thanks

At least they're still introducing new products.

How much longer any of these companies can afford to r&d and
manufacture and service amateur radio equipment is something to
consider.

Most of the great American companies are out of the amateur business.
Drake. Collins. Hallicrafters. National. Hammarlund. Gonset. Heath.
Atlas. Swan. Etcetera...

A fine company like Alpha even nearly bit the dust.

How much longer will the Japanese keep at it?

Thanks for reading this!

I have recently acquired a Radio Shack HTX-10 10m radio. These sets were not available in the UK so I consider myself fortunate!

However, I'm in need of some service information to allow me to check out the radio, as it appears to have been tampered with internally. So if anyone has a service manual, I would be very grateful for a copy. Failing that, could anyone tell me the method for aligning the TX and also the method for calibrating the "S" meter? My set is only producing about 10 Watts, so it probably needs a little work. It appears that there are a couple of trimmers for setting the power output but I'm loathe to do any further work without more information. A schematic would be a great help!

If you can help, I will gladly pay any costs involved.

Thanks to everyone who posted . With some messing around (and
the collective comments of the group) i have indeed determined that
my SWR is off the scale. Stuck without a tuner, i went out and
bought the MFJ 949E ... tuner/swr/dummy-load all in one. On bypass
mode, it confirms an off-the-scale SWR, but was pretty easily tuned
down to nearly SWR 1:1.

Jim, I don't know where you are getting your information from, but I think
your information is not correct. The number of re-tests is usually very
limited and focused on a specific exam session in question. They usually
ask you to test at a different VEC, not necessarily an FCC office.

Although I personnally would have taken the refund when offered, I am a little more sympathetic towards John than some others.

1. Anyone who spends $5K+ for an antenna from a commercial manufacturer should reasonably expect that the antenna design has been fully tested and that the product has undergone significant quality checks. Obviously, this was not the case as parts were missing from the shipment and the company admitted that while the design worked there were problems with the first units into production.

2. A visit to Mosley's web site reveals terms of sale that would make me think twice about ordering anything from these guys. For example, a 5% cancellation fee if you cancel a credit card order and various stocking fees if they can pin a mistake on you or if you fail to act quickly enough. On a big order - like $5k this can be a costly mistake. I tend to stray away from doing business with companies that try and impose penalties and tend to favor "customer friendly" companies.

3. Mosley showed absolutely no sympathy for John and did not seem to be doing everything it could to resolve the problem. They could have prioritized getting his antenna working and they could have been a lot more tolerant in their communications. Obviously, John was upset - wouldn't you be ? They should have taken the high road here.

4. In my opinion, Mosley simply demonstrated some very bad customer relationship handling. As a result, the customer got pissed off enough to take legal action. A company like Mosley should never let this happen. In the end Mosley could wind up losing a lot more money than it was worth. The radio community is a very small and "communicative" bunch. Many hams also work as professionals in this field. Bad experiences do carry over into the professional world and stuff like this sometimes comes back to haunt.

Neat. Someone actually thought of not charging. Of course, my first licenses cost nothing - it was just the 60 mile (one way) drive to Buffalo that cost a bit of time and money (gas, thruway tolls, parking, etc.). The cost is actually minimal anywhere. I think I paid $5.90 when I decided to get back into amateur radio and tested out in 1993 (after letting my tickets expire over 10 years earlier). Whats the cost today?

Bob, I think you are absolutely correct. Although one might assume the manufacturer simply wants to 'line his pockets', look at the companies that have gone out of business. For the manufacturers to survive, they need new amateurs being licensed. Very simple. This code/no code argument will go on until, ultimately, the code requirements are eliminated. By that point, we may be down to 50,000 licensed amateurs and who wants to sell to a virtually non-existant market? Perhaps I exaggerate a bit, but how many licensed amateurs does the USA have? What is the total population of the USA? Now, same questions, but substitute 'Japan' for 'USA'. Questions?

Thanks & 73 from Rochester, NY
Jim (AA2QA)

Batteries can be obtained through 3rd-party vendors (like Access Batteries) much cheaper than from Big-M, who doesn't support the radios any more. The big problem is channel elements. They are NOT synthesized radios and are not xtals, they use Channel elements. IF there are elements in the radio (2 for each channel you want to use) then you can send them out to get re-rocked to the right freq for about 30 bucks EACH. If there are not enough elements in the radio (Like you want 6 channels and there are only 2 in the radios now) it's gonna cost you upwards of 90 bucks EACH for elements, IF you can find them.

As for PL, they are a single-PL for the whole radio (not one code per channel, one PERIOD) and it uses an active filter (much like a Minitor II pager). Getting one of these in your PL tome is like pulling teeth if you get lucky enough to find your code used. New, you can plan on spending upwards of 90 bucks for a new PL filter.

If the radios are NOT on your freq and NOT on your PL, don't even take them for free. Grab a used handful of HT600's or other synthesized radio. If you're planning on using them for personal reasons, go with FRS. The MT500 is quite a BRICK and is not very flexible.

353. Equipment feet

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-08 08:24:13 UTC
From: Chris Kepus <ckepus@no.spam.calweb.com>
Message-ID: <01c0794c$5f0c7060$5751d3cf@chris>
Source record: 66378

I need to find a source for some new feet for my RX. The originals were cylindrical, 1 5/16" dia., 1 1/8" tall, drilled center hole to accommodate a 10-32 screw, and a counter sunk area 1/2" in dia. to allow the head of the screw to be recessed. These feet were originally a brittle plastic (kinda like Bakelite) with a somewhere between a flat and satin black finish. I am looking for replacement feet that are either machined aluminum that could be powder coated or a nylon-like plastic that can be machined and has the requisite (or close) black color. Any referrals out there? Please reply to this message by deleting "no spam" from the email address.
Thanks es 73,
Chris

354. HF Amplifers Sale!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-08 09:53:25 UTC

Source record: 66379

Hello, I have alot of 80-10 meter amplifiers for sale, after the closing of a retail outlet, below is a price list:

Mobile Units: (these units require about 30 watts drive, have selectable power output, and have a 20DB receive pre-amplifier)

KLV 100 watt unit: $89.99
KLV 300 watt unit: $175.00
KLV 300 watt unit with thermal protection: $ 225.00

The units below all have thermal protection, and SWR protection:

KLV 600 watt: $399.99
KLV 800 watt: $435.99
KLV 1200 watt: $799.99

Base Models: (all base units 110 volts)

Tube Type: (these units use the 811-A, or EL-519)

KLV 200 watt: $234.99
KLV 400 watt: $434.99
KLV 1200 watt:$699.99

Solid State:

KLV 300 watt: $599.99
KLV 500 watt: $699.99

My name is Justin, and I can be contacted at (909) 279-4193,
or at: justindepolis1@aol.com You can also check out my web site for more information:
http://www.geocities.com/ham2way2000/index.html
Quantity pricing available, and prices can be negotiable, thanks, and 73's.

>BOYCOTT KENWOOD!
>

I simply can NOT tell the difference between CBers and Hams anyway. The distinctions are so minor that it is difficult to understand what all the fuss is about. About the only observable difference is one of over-the-air jargon. AM-CBers say "10-4", SSB-CBers and Hams say "roger-roger". Cbers say "webe 10-7", hams say "webe distinated and clear".

So really now. WHAT is the big deal?

Shit-can the license completely and there will be little observable change. There will be no major addition to the jammers and pigs on 80 and 40 meters, there will be no major change is the silly ham-speak on 2 mtr, there will be no noticeable difference in the crowding on 20mtrs. About the only noticeable thing is that it MIGHT keep one or two manufactures in the market.

Ya sure boycott kenwood. They DEPEND so much on the ham radio market for their business. Kenwood is doing you a favor asshole, you are just too stupid to realize it.

Hams *do* build their own stuff- look at how the QRP stuff is really
catching on!

There always should be room for manufactured equipment as well as
home-brewed. I certainly wouldn't want to go back to the really old days
of needing to build everything including most all of the individual
components in the rigs.

Yaesu FT-890 transceiver with the following features:

1.XF-110C 500 HZ CW filter installed.

2.MH-1B8 hand microphone with up/down scanning buttons and Heil HC-5 cartridge installed.

3.Three spare meter lamps.

4.Original manual and box.

5. Power cord.

Please note, this radio comes with only the items listed above. IT DOES NOT HAVE A TUNER.

I am the original owner and the radio is in excellent condition. On a scale of 1 to 10 it is a 9+. It has never been used mobile and has always been in a non-smoking environment. The radio was primarily used as a receiver and the finals have low operating hours.

$550.00 plus shipping

Thanks,

Rex,

We don't know the other side of the story. We don't know how Mosley initially handled things. A 5% cancellation or "restocking" fee is very low - often this runs 10-17%, and is NOT uncommon. It is not free to run stuff back through the warehouse, verify completeness and restock the shelf. In some cases the materials cannot be resold as "new", and you are paying for that loss.

The original poster may have a legitimate gripe. We only heard one side - from a really biased perspective. I've run into some pretty stubborn retailers, but it always leaves me wondering what REALLY happened when someone posts this sort of blanket indictment of a company.

>
.

1) When did Kenwood start making CBs?
2) Kenwood has such a large market share in the home and automotive electronics market that I wonder why they even bother with the ham market. I doubt the possible increased radio sales that might occur if code was eliminated would even register as a blip on their bottom line.
3) If you are concerned about the effect no-code might have on the bands, you're right, maybe it will improve it. As an example, during the recent ice storm in Texas, I heard a couple of 2x1 callsigns who were interfering with the emergency traffic net on 3875 and were politely asked to move down. One said "Why should I, I'm not near Texas? And I'm only running 500 watts." His buddy agreed with him and they continued their discussion for another 10-15 minutes. At least the CBers I know will yield to emergency/rush traffic.

Grow up, get a life, and sign your name and callsign to your posts, and MAYBE we'll start taking you a little bit seriously.

379. Heathkit HD-1410 manual info needed

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-08 19:48:01 UTC
From: pawsqrd@aol.com
Message-ID: <20010108144801.01363.00000026@ng-fm1.aol.com>
Source record: 66305

I recently bought a Heathkit HD-1410 keyer.

Now I need the component layout and maintenance/troubleshooting sections
of the manual.

Can anyone out there make a copy and send it to me either by e-mail
or by snail mail. I'd be glad to pay for any expenses incurred.

Thank you.

I need advice on purchasing the controller interface between radio and computer.

I have the paperwork from Arizona to become a MARS station and would like info on the best of all worlds for the hardware and software to meet the military's needs at my end for data transmissions to my station.

I looked at the MFJ-1278B and someone recommended the RigBlaster, but it seemed limited.

Any ideas and any info on other interfaces would be greatly appreciated.

I need maximum features for send and receive.

You are compairing aples and oranges. The Rigblaster is an expensive, simple ? interface for the audio the the soundcard interface. The 1278 is a complete interface that does all the decoding. Unless you can install some new eproms you will be stuck with whatever modes are built in. Some of the sound card programs are very good now. Look here for some soundcard softwear.

http://www.muenster.de/%7Ewelp/sb.htm

The MMTTY is free and works very well for RTTY. Almost as well as any hardwear demodulator. All most rigs need to run the soundcard programs is to hook the sudio out of the radio to the aux input of the soundcard. this will get you going on receive. You will probably need a two resistor network to cut the sound card audio output down that goes to the audio input of the transceiver. I usually set the rig to use vox to key up while in the digital mode.

Not sure what modes you need for mars, but you should be able to find most all of them in the above url.

I agree that restocking fees are "normal", but the 5% cancellation fee that Mosley could charge is nothing more than a penalty. In this particular case they have done nothing more than credited a charge card and then reversed the transaction.

BTW - didn't I read somewhere that MFJ has bought HYGAIN ??

388. Yaesu FT747GX problem

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-09 01:13:39 UTC
From: dslosty@pipeline.com
Message-ID: <3a5a64bd.19222155@news.pipeline.com>
Source record: 66313
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi,
I'm wondering if any other owners of the FT747GX have experienced the
following or a similar problem:

The transmitter seems to go into oscillation, and the
power output indicator on the S-meter pegs. However, Vcc
current actually falls and output on an external wattmeter
drops to 10 watts or less.

This condition probably blew the low level RF driver transistor
Q32 on the main PCB. I've replaced that and operation is normal
most of the time. However, occasionally the symptoms reoccur.
One clue that it is starting is that the keying time increases
dramatically, i.e. if the transmitter is keyed, the power gradually
rises to 100 watts over a period of about 4 seconds. If the
transmitter is kept key down for 30 seconds or more, oscillations
begin and the power drops off. These spurious oscillations
can be heard on external receivers.

I don't think the problem is in the final amplifier assembly.
If RF drive to the final is disconnected and a 'scope put onto
the RF output of the main board, the delay in rise time can clearly
be seen when symptoms start. Thus the final amp (unless there is
some strange feedback in the ALC/SWR sensing circuit) isn't causing
the problem.

Anyone have any thoughts or suggestions?

Yaesu hasn't been too helpful.
Plus, their current waiting time for factory service is something like
8 to 12 weeks. With an intermittent problem like this, I could end up
sending it to them a couple of times. In any case, I like to do my
own servicing.

73,
Doug/WA1TUT

Rob,

The Eico 753 was my very first HF radio. Yes, it does drift at first, I used to leave it on stand by all the time, then when I wanted to operate, move it to operate mode, and not as much drift.

If I remember right it's 100 watts output. Only covers 80, 40 and 20 meters. You can find a manual from Eico, they are still in business it looks like.

Calls are accepted on Monday, Wednesday and Thursday from 8:30 AM to 2:30 PM Eastern time.

397. I like the MFJ 259 antenna analyzer

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-09 04:28:08 UTC
From: pat jankowiak <vaxhackery@worldnet.att.net>
Message-ID: <3A5A9286.C5A10B9D@worldnet.att.net>
Source record: 66320

Although I am not a ham radio operator, I do experiment, and I collect old military radio gear.

I just want to say how happy I am with my MFJ 259 antenna analyzer. I have put a real nice military antenna originally made for the GRC-106 radio, a 2-30 MHz tranceiver, on my van.

This is a whip about 11 feet tall. It looks really great (big, imposing, ugly, green antenna), but the thing resonates at 23 MHz! I was able to find this out, as well as the Xc and Xl of the antenna at verious frequencies, with the MFJ 259, and whip up an antenna matcher for use with my Chicken Band radio. It's amazing what you can do with 4 watts and a big antenna..

I also have found out all kinds of interesting things about the input circuits of linear amplifiers (I buy the tube kind nonworking, repair them, and sell them to ham radio guys.. I do have an FCC ops license after all.) It's amazing what a strange match alot of these linear amps present to the radio.. and no, I don't work for MFJ!!

"AM Plate Modulation Forever!"

Japan is the only reason I/Y/K/A Make radios at all- In Japan
amateur radio is a sport; a national hobby if you will. The
market here is barely large enough as it is- if you notice, all the
radios that get sent to the us market are spinoffs of what they
have back in .jp, and sometimes we don't even get some of the radios
they make, because the cost to certify and introduce the radio into
the US market outweighs the benefit. Some radios have even been
withdrawn, IE the Icom 970. Pulled because it simply didn't sell
enough to justify IA keeping stock around...

403. Question about Radials

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-09 13:09:10 UTC
From: J Titcomb <kimoloka@hawaii.rr.com>
Message-ID: <W3E66.61169$Z36.434742@typhoon.hawaii.rr.com>
Source record: 66327

This is going to sound dumb, but here goes anyway. Are the radials supposed to be connected to the base of a vertical antenna, or do they just radiate out from around the base, but are not actually physically connected? Its hard to tell from a schematic diagram. Sometimes it looks as if they are actually connected to the base of the antenna. If the radial system were to be connected to the base of the vertical, and if one were to make a homebrew vertical antenna fed with coax, would one solder the shield to the radial system, and the center connector to the vertical portion of the antenna? That seems like a short to me. Thanks

Yes and no- having to build stuff which is equivalent to the
commercial equipment would cost a heck of a lot more than
the commercial equipment costs....

On the other hand, you wouldnt be able to complain about
performance, cause the builder would be directly responsible for
it... :)

I was just about to order a Mosley antenna but after seeing your post and Web Page I have decided to go with another Manufacturer. I just can''t take the chance with my hard earned $ and also can not afford a long legal battle with them. It just isn't worth it.

With all I hear about how valuable real estate is in Japan, and how little space most people have, it must be a real challenge to put up decent antennas. Add to that the Japanese inclination for electronic gizmos, it must be an even greater challenge to not tear up the neighbors' gizmos with RF, especially considering how living units are stacked atop one another.

Maybe they're all runing QRP into slinky whips in the attic?

I wonder why that's the case. Are Americans just less interested
in radio communications or did we miss the boat by using code to
keep the CBrs out back durring the CB craze of the mid 70s or
???

Hi:

I have a neat item for the right person.

This is a Mobile Charger for the MTX / MT1000 / HT600 Series of radios.

This will keep your radio fully charged while in a vehical. Runs off 12 VDC
Comes with New Power Cord, Bracket, and original hardware.

Its been in storage for sometime, but has NEVER been installed. Still
has the plastic film on the front (radios for example only-Not Included)

$100.00+$8.00 for Pirority Mail Shipping, Handling, Insurance, Tracking.

Photo can be seen @

Check the low value resistors on the base of the final transistors. I think
they are 47 ohms. On a production run they seem to have got the colors
wrong. Take them out of circuit and you may see that they are in fact 470
ohm resistors. Replace with 47 ohm and all should be well.
Good Luck.

The Japan I saw was mostly small buildings. Judging by the location of
towers, neighbours do not care much about clearance from their properties.
Towers are of decent height, mostly 50-60 ft, and higher height means
generally lower interference.

417. FS: Kenwood V7 Dual Band Mobile + Accy's $425

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-09 18:45:17 UTC
From: officer821@att.net
Message-ID: <1%I66.1303$fr.72887@bgtnsc04-news.ops.worldnet.att.net>
Source record: 66343

RX: 108-174, 300-470 MHz
TX: 137-174, 410-470 MHz (MARS/CAP Modified)
280 Channels (180 if using the alphanumeric channel naming function)
Built-In Duplexer, Packet Ready
V/U, V/V, U/U
5,10,35/50 Watts Out

What You Will Get:

TM-V7 Radio + Microphone
Instruction Manual
Mobile Bracket
Power Cable
DFK-4C 13' Detachable Display Front Panel Kit
PG-4S Computer Programming Cable + Software
Comet B-10NMO Dual Band Mobile Antenna
NMO Magnet Antenna Mount

What's Missing:

Mic Hang-Up Hook

Condition:

This radio is in great condition. It has spent about half of the time mobile,

the other half in the shack. Transmitted very little, maybe 2-3% of it's
total life. Two flaws that I want you to know about: #1) Very small inner
chip in the lower part of the screen, however you really have to look close to

see it, as it's not even over the viewing area of the screen. #2) One of the

vertical lines in the LCD isn't working for whatever reason, could be
temporary. It's located over the middle of the last digit of the VHF display,

so it does not impact on seeing any of the settings.

Why am I selling this? Just to help pay for other radio projects!
There is nothing functionally wrong with the unit that I'm aware of.

$425 - shipping to the 48 states included.
I'll either take a money order or PayPal.

Photos available upon request, please e-mail any questions.

Thanks

I thought that was the point. I'm hazy on the details, but Japan has
long had a license that has a 10W power limit. It may be codeless,
and I thought it's been around for decades. Twenty years ago, I
remember comments about this being a very popular license. Whether that's
still true, I don't know. But a simple, almost local license, would
account for big growth, and the low power certainly has it's advantages
in a populous country.

I've got a Radio Shack DX-390 that was working on the AM and FM bands until I decided to repair the blown FET transistor. I botched the job and damaged the circuit board and melted who knows what in the area of the transistor. If you want a microsurgery project this is for you. As is. Absolutely no guarantee that it's fixable. Make me an offer and you pay shipping. Please send your response by e-mail to: mcotton@gte.net That's also my eBay handle if you want to check my rating there.

Good Evening:
I have a RCS-4(That is for HF only) remote coax switch for sale. I purchased this from a local ham who needed the coax switch for up to 2 meters. It has the original box, directions etc.
I have never used it, he(previous owner) had it up for two weeks.
$100.00 shipped(Conus), Postal money

It would take several books to answer your question :-)

But basically, the better radios have better selectivity in reception,
a better ability to distinguish a station on a crowded band.

And a better ability to keep from being overloaded by strong signals.

And a greater sensitivity, the abilty to pull a weak signal out of the
noise.

I'd just pick any middle grade transceiver that works, that doesn't
need repairs -- and after you use that awhile, you'll learn what to
look for in a transceiver.

The Kenwoods are good, the 120, the 520 and 530, the 820 and 830. Also
the 430 and 440 series. Just get one that works and use it. Experience
is the best teacher.

Good luck!

Bob

One thing that they fail to mention in the manual for the RT systems
software is that you have to change the radio to 9600 BPS mode for the
packet. This will then properly match the 9600 BPS port rate of your
serial port. Mine did not work until I made that change!

I have two modded FT-50's, had good audio reports everywhere. Works fine with the kid's FRS radios, get good signal reports on local repeaters. Maybe just something wrong with that unit....as far as power output goes, I assume it's pretty close to in-band, as it seems to have comparable transmit capability to my commercial HT's.

445. FS: Swan 400 xcvr, 420 vfo, 117B p/s

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-10 14:42:11 UTC
From: k5dh@raytheon.com
Message-ID: <7x_66.10$K06.1265@dfw-service2.ext.raytheon.com>
Source record: 66421
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

For sale:

Selling for an inactive ham whom I work with (Larry, W5DXW):

Swan 400 transceiver, 420 vfo, and 117B power supply. This is a
PROJECT RADIO, not a museum piece, and it needs work! If you're
not able to work on old tube-type radios, this one ain't for you.

Operationally:
I powered it up and it receives surprisingly well on all bands,
and does not emit smoke or flames (don't laugh... I had an old
rig from an estate sale catch on fire on me once!). I did not
test the transmitter because I don't have a suitable antenna or
a dummy load available at the workbench in my garage. All I had
handy was a 6-meter mobile mag-mount antenna, hanging upside-down
from the garage door track, and I was amazed at how well signals
came in. The controls and switches need to be cleaned, for sure.
The vfo is stable and appears to be in good calibration. The
crystal marker is also working, but I'm not sure how well it's
calibrated (easy enough to adjust, however).

Cosmetically:
The set is in "good" cosmetic condition, but it will need a bit
of cleaning and sprucing up. All of the markings on the front
panel are present, but most are worn (still readable, though).
The gray paint is good. The cabinet has some scratches and
chps in the paint, but it isn't ugly and it isn't dented. The
vfo and p/s look good (especially the p/s - it shines!). There
is a chip in the edge of the meter face, but the face isn't
cracked and the meter works. The rig came from a non-smoking
household, so there's no nicotine residue (thankfully!).

Miscellaneous info:
I do not have a printed manual, but I do have three 5.25" disks
with scanned manual pages that I downloaded from K4XL's BAMA. I
believe that the rig has been in Larry's family since it was
new. I know his Larry's father owned it before he did. I don't
have any pictures of it, nor a means to take and post them easily.

How much is it?
The price is $150.00, and the buyer will pay shipping charges
(or, can come by my house and pick it up, a few miles north of
Dallas, TX).

Dean, K5DH

I have seen this posted before and I know Chevy has a fix for it. I have narrowed down a bad RFI problem I am having with a new 2001 Chevy Tahoe. After isolating the power, antenna, checking all grounds with no results. I pulled the relay for the fuel pump and the RFI disappeared. (of course the engine quit after 10 seconds) That pretty much isolated where the RFI was coming from.

Now my problem is my local Chevy dealer. They have no idea what I am talking about nor can they find any bulletins from Chevy. I know Chevy is aware of this and has a fix as I have seen it before.

If anyone out there knows the part # or the Chevy Service Bulletin #, I would appreciate it.

Thanks
N4DIA

Due to a recent berievment in the family, I have a load of radio (and
miscellaneous
electronic) gear to sell.
We live in Maidstone, Kent and any equipment can be viewed/tried before
purchase.
A 10% contribution will be made to charity for each purchase.

I am compiling an online catalogue at the moment, which can be viewed at
http://www.bstard.com/dadradio

Regards,

Paul Waldren.

460. Kenwood TS-50S heats up

Newsgroup: rec.radio.amateur.equipment

From: Sinan <suluvar@my-deja.com>
Message-ID: <93ijdk$h1v$1@nnrp1.deja.com>
Source record: 66436

Hello all,
I had a problem with my equipment after operating just a few times.
I operated it with the AT-50 tuner.
The problem is as follows:
When the power is connected to the rig, the heat sink becomes hot just in 1 minute even with the main switch is off.
When I noticed this I immediately disconnected the power. At this moment or at receive mode it draws about 11 Amp. I can not transmit anything and display shows "HELP" momentarily when pressed to mic. xmit button.
The service is troubleshooting it. They checked the transistors at the output but they seem OK.

Has anyone experienced such a problem?
What might have caused this failure? (I do not want to repeat again.)
Any idea of source of failure in the equipment?

I would appreciate any feedback.
Thanks,

Sinan

Source record: 66438

Be gald the Eico deal fell through. Not much of a radio by todays
standard and not that much by the old standards either. Look for some
of the older Kenwoods like a 520 or 820. Yeasu made some and the 757s
are going for about $ 300 to 400, but you need a $ 100 or so DC power
supply and you probalby will need an antenna tuner also. The old
Heathkits like the HW101 and SB101 are not too bad if they have been put
together well.
I think I would stay away from the old Swans and Tempos. Most Swans
drift a bunch and some of the Tempos have a very expensive tube in them
if you have to replace it.

From: Mike <w4mjr@home.com>
Message-ID: <3A5CE8B7.56D38BC6@home.com>
Source record: 66439

I have been reading some negative feedback on people not wanting to send icom gear back to Icom service for repair.Whats the deal ? I haven't used the service in over 2 years which at that time was alittle slow but good service. I have something that needs alittle work but now uneasy about sending it in. I do know that you can forget the idea about talking to someone on the phone at Icom unless you don't mind waiting along time.
Anyway any comments ?

Keep your eyes open for a solid state rig, 120/130/140/430, etc., etc., a lot easier to live with, and most of these are within a few bucks of one of the respectable tube rigs. No need to retune with band changes, generally smaller footprint on the desk, also give a look at some of the earler TenTec rigs, all around great rigs and near-legendary CW qualities, Triton !V's can be had for a couple of hundred dollars with a little looking around.

Charles,

You won't have any audio without having two of the pins jumped. You need
to jumper the upper left and lower left pins to get audio.

Good luck with the rig.

I had the same thing with a yaesu 23r on the dry cell pack, i did use
nicads and i learnt the hard way

Nicads sometimes use the whole battery case as negative so if the
plastic label is damaged on the battery there can be a short from one
battery to the next if the two batteries are place so close to each over
that the outer cases touch and the pos from the first battery finds a
path thro the next battery back to its own negastive,
i hope this makes sence i have written this in a hurry

regards mark

For sale, a nice IC251e 2m multi mode. This rig is old, yes, but it is a very nice set. 10 watts of decent RF into a linear (100 watt, available too!) and what more could you ask for.

Complete with box, op manual and service manual.

I'm after a new HF set, hence the reluctant sale. The rig is £200, the rig and amp is £250. I will sell the rig without the amp, but not tthe amp without the rig.

(May be repeat - first ones didn't show after 24 hrs.)

Have three 40', two 60' and one 80' crankups for sale. Light duty,
custom made for wireless cable. Used for site survey. Galvanized. 40'

are 2 section, 60' has 3 and 80' has 4 sections. (about 2-1/2' overlap
per section) Have driven rod type base for most. Will throw in guy
wire and set of 4' earth anchor screws. All neck down to 6" face on
top section. Top section has brackets at top for mounting 1-12" mast.
Would be good for verticals or small/medium VHF/UHF beams.

Asking $125 for the 40' ones, $175 for the 60's and $250 for the 80'

LOCAL PICKUP (I've moved them all once!) Central Mississippi area.

Email direct for details. I am in and out so don't fret if reply takes
a
day or two. - Thnaks. Bruce, KD5IUG

493. Antenna Info??

Newsgroup: rec.radio.amateur.equipment

Are there any websites thst teach how to make mobile and base
antenna's? Mainly mobile. Why couldn't a wire wound pre-tuned
fiberglass CB antenna be used for ham radios?
I'm mainly refering to 2 meter equipment.
Thanks

Hi Brady, thought Id give you my 2 cents, since I buy and sell radios a lot..First you need to answer these questions to yourself...do you need an auto tuner? (make sure you get 690sat if you do), is it for base or mobile use? (size matters) and what is your budget? (690sat is probably bringing around $700-750).....OK, the tuner if you are going mobile, is not necessary...it just wont help you if you do things right mobile.
If you plan to use an amp, it wont be usefull either in most case...If its for base use, the size is fine, for mobile a bit large.....for not a lot more money you can get more radio depending on what you are going to do with it....THe 570S KNWD is probably only 100 or so more and has a great dsp and some newer features....If you really want 6 meters, youll have to buy and amp for the Knwd as its low power, may as well look at and ICOM 736 around $900, or an ICOM 746 around $1000, then you really have a radio...many other options, and dont get me wrong, the 690sat is a great rig....just wanted you to consider ALL the possibilities...73 enjoy...Murray K5MDM

I need the part number for the 2m final pack in the Icom IC207H
radio. I would like to know the number stamped on the plastic case,
but the part ID from the parts list would be OK. If you have the
schematic for this radio and could look up this info for me, I would
greatly appreciate it! Thanks and 73...

>
> tnx,

They say that because the alk packs don't have the parts needed to reduce current etc. in case of accidently overcharging. The normal ni-cad packs have a thermal sensing device to reduce the current in case they get too hot. You can actually charge ni-cads in the alk packs just fine, but you have to be real careful not to overcharge. I have a six cell pack I stuck nickel hydrydes in. No problems here, but I have to keep a voltmeter on the cell when charging to know when it's fully charged. With ni-hydes there is a slight voltage drop when you get to full charge so it's pretty easy to tell. MK

Hummmm, Riley takes a real dim view of jamming emergency traffic. Often
on 3873 etc. "Thats a common freq used." I happen to talk on 3870 quite
a bit and have heard them 3 kc's up. Myself , I wouldn't dream of
jamming these guys. If Riley catches them doing that, it will be their
ass, and you can take that to the bank. It's happened before on that
freq. And the fcc monitors those freq's often when those nets are in
session. MK

So if I don't charge the batteries IN the pack itself (ie. use
some other charger) then I should be OK, with the one caveat about
possibly shorting nicads through the sides?

What about rechargable alkalines?

Source record: 66278

I have an Astron RS70A PS for sale in excellent condition. No noticable scratches or "dull" finish. Works perfectly. $225 + shipping.

I have become radio "poor" and have more HF rigs than I can use. So I am selling my Kenwood TS-50. It is in excellent condition, no scratches, and I have used it as a base rig only. I have the manual, power cord, and the rig has the SO-2 High Stability option installed. Price is $650 + shipping. This price reflects the price of the HS option which I bought myself. Please email if interested.

Thanks

Jerry

I ruined a Alinco 2 meter HT because the rayovac renewals leaked.
The death was slow and tormenting, by losing one feature at a time.
I cleaned up the printed wiring board with nasty stuff, and cleaned and re-ran corroded traces.
But as the weeks go buy, more features don't work. i.e. keypad buttons,
and every time I power down the rig it loses it's memory.
My advice from experience is to stay away from the rechargeable alkalines.
Al, N2NKB

508. Re: Why nagative feedback on Icom?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-12 00:22:47 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <3A5E4E57.E98@bellsouth.net>
Source record: 66285

I just got an IC706 back recently that was gone about 3 weeks. After the rig mysteriously blew its finals (working one day, not working the next day when I turned it on), I did what troubleshooting I knew how to do and ordered finals for it thinking I may be able to replace them and go on. It still didn't work, so I snooped around some more and discovered a transformer blown/burnt. I couldn't seen anything else (darned tiny components and my weak eyes!), so I ordered the trans. Put that in and got about 30 watts total out. Hmmmmm. I just couldn't trace what else was the matter. So out to Cali. it went. Seems it burned a couple of little chips (can't see again). I don't really have any complaints. Here's one hint, tho. If you send a radio to Icom repair, and they tell you they are out of the part they need, talk to the tech (I know, it takes a long time) ask them to see if they have a board that was removed from service that has used (but good) parts needed to repair yours. It will get your radio back to you quicker! Seems they don't keep a complete stock of repair parts, and when they have to order them from Japan, they come by slo boat via China! That's the only complaint I have about their service. I did this once when they were backordered, and it cut the time quite a lot. Just so happened they had a board removed from a 706 that had something I needed. It was perfectly good (the part I wanted), and they gave it to me free of charge!

I don't know what caused my radio to just self-destruct like that, but they did work with me on it.

If you have a need for an SMA-TO-BNC antenna adapter that is custom made to fit and protect your H.T. or scanner radio, I have the solution.

Adapter allows you to:
Quickly change antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed for moisture and dirt protection.
The base also provides an excellent support for any length of antenna or application.
No need to remove adapter once installed to make a quick and safe antenna change.

Sizes to fit radio models:
Yaesu: VX-5,VX-1,FT-50-R,VX-10,VX-150,VX-110,VXA-120
Icom: IC-T8A,IC-T81A,IC-Q7A,IC-R2
Kenwood: TH-D7,TH-G71
Alinco: DJ-V5
Radio Shack: HTX-200,HTX-400,HTX-245
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000 Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)
(Specify radio model when ordering)

The Kenwood TS690SAT and it's little brother the 450SAT are, in my opinion, excellent rigs and the best bang for the buck available. I have owned both and used them for contesting. They run cool and quiet and neither one has ever made a trip to the shop. All they really need to bring them up even with top of the line rigs is a couple of optional filters. I have gotten compliments on the audio of both rigs using just the supplied Kenwood hand mic.

I sold my 690 in order to trade up to an Icom761. If I didn't already have a 450 on the desk, I never would have gotten rid of it.

Here are my choices for a first rig depending on how much you have to
spend:

$300 Kenwood TS120 - dependable rig but old and no 160 M or WARC bands
$400 Kenwood TS130 , 140 or 180 upgrades of the 120 more bands
$500 Icom 735 Solid little rig good sensitivity
$600 Kenwood TS50 Hot TX good sensitivity, maybe a little too much
$700 Kenwood TS450SAT Good workhorse radio with good TX and RX
or Yaesu FT900 same as above

Kevin,

The deviation of the FT-50 is wider than FRS uses, so it would have a tendency to be hard to understand. Also, unless you use 12.5 step rate, the FT-50 will not tune to the FRS channels. Even when the proper frequency is displayed, I would check with a counter to be sure. Last, but not least, it is not type accepted for FRS use.

FWIW,

David

Seems to me that you are getting what you asked for in Dec 99 by refusing to accept the refund and demanding an antenna that works. It doesn't seem terribly unreasonable since attorneys are involved that a settlement agreement be signed before they make good on their side.

Gee, if they don't want you to keep flaming them on the net just hoist that baby up to the top of the tower and hang a giant sign from it with any derogatory statement you want. If the antenna doesn't work this time - at least everyone in your neighborhood will know how you think about Mosely.

Maybe you can get some advice from people here as to what you should put on the sign !!

To All who emailed me with ideas - Thanks!

I have found the root of the problem. Anyone with a 2001 Chevy truck with a gas tank of 30 gal or more might run into this RFI. The tank is made of PVC or other plastic composite. It is not metal. The fuel pump is mounted on the TOP of the tank. (yes, you have to drop the tank to get to it)

By working my hands as close to the pump as I could and pulling the leads out of the wire loom and snapping on ferrite beads, I have removed 75% of the noise. I will be at a friends auto body shop in a week or so and we are going to pull the tank, build a shielded cage for the pump and ground it. That should take care of the other 25%.

It took me making a list of things different about the 1999 Tahoe and 2000 Tahoe to figure this out. The 1999 had the same pump, but it was mounted on a metal tank.

From: Keith McQueen <kb7m@arrl.net>
Message-ID: <t_v76.3626$dy.664364@news.uswest.net>
Source record: 66202

I love my TS-690SAT. I had borrowed one for a few weeks, and liked it so much that I went looking for one. Luckily, I found a mint condition unit on the internet for a good price and bought it. The '690 is the same as the popular TS-450SAT without 6m. I own the Kenwood, an ICOM IC-706, and a Yaesu FT-100, and the TS-690 has the best receiver of the three (alright, alright, I admit the other two are technically mobile rigs...). I use the TS-690 for both base and portable operation. The internal automatic tuner is a joy to use. It does not support 160 or 6 meter bands, but works very well on all others. I have gotten good audio reports with the rig.

537. SALE!! HF Amplifiers 80-15M

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-12 10:06:45 UTC
From: justindepolis1@aol.com
Message-ID: <20010112050645.05476.00001279@ng-cl1.aol.com>
Source record: 66212

Hello, I have alot of KLV Series 80-15 meter amplifiers for sale, after the closing of a retail outlet, below is a price list:

Mobile Units: (these units require about 30 watts drive, have selectable power output, and have a 25DB receive pre-amplifier)

KLV 300 watt unit: $175.00
KLV 300 watt unit with thermal protection: $ 225.00

The units below all have thermal protection, and SWR protection:

KLV 600 watt: $399.99
KLV 800 watt: $435.99
KLV 1200 watt: $799.99

Base Models: (all base units 110 volts)

Tube Type: (these units use the 811-A, or EL-519)

KLV 200 watt: $234.99
KLV 400 watt: $434.99
KLV 1200 watt:$699.99

Solid State:

KLV 300 watt: $599.99
KLV 500 watt: $699.99

My name is Justin, and I can be contacted at (909) 279-4193,
or at: justindepolis1@aol.com These units are not intended, nor designed to be used on the 11-meter (CB) band, if you ask, you will be denied service, all can be used on 10 meters with slight modification. You can also check out my web site for more information:
http://www.geocities.com/ham2way2000/index.html
Quantity pricing available, and prices can be negotiable, thanks, and 73's.

This is the part I don't understand. You have more frequencies in more bands with more modes. All for a scattered handful of operators. It doesn't matter to me if CW stays or not, I'll take the test anyway. The common perception of HAM radio as the elite of radio is failing as fast as the number of its operators. When I listen to some of the crap on the 40 meter band I wonder what all the hype is about. So now you boycott someone that is at least supplying a viable means for your hobbie to survive. If you don't like CB stay off 11 meters. If CBers try to talk to you just say no. Maybe if you spend about 20 years on CB like I have you will appreciate all the options that you have. I take my test at the end of the month. I only need to study things like Modes vs allocated frequencies and all those damn rules. (LOL)

543. Help : Where is JPS communications?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-12 13:00:15 UTC
From: Wonki Oh <HL4SF@hitel.net>
Message-ID: <93mv9imgi1@news1.kornet.net>
Source record: 66218

Hi,
I have a NIR-10 DSP noise/interference reduction unit from JPS.
It has the problem now and I want to send it to JPS for repair. But I can't find their address now.
Can anybody e-mail me what happened to JPS and how can I fix this unit?
Your help will be greatly appreciated. Thanks...

Wonki, WM2X

P.S. my e-mail address : HL4SF@hitel.net

People here seem to have good luck by simply e-mailing their problems
to the Heil company. Often, Mr. Heil, himself, responds... You might
check their web site...

From: kenjenlee@usa.net
Message-ID: <93n2ju$ao2$1@nnrp1.deja.com>
Source record: 66222

Schematic diagrams for many ham equipment are at:

http://krasnodar.online.ru/hamradio/sch_eng.html

For ERW-4, click the link "Schematic of programmer" under ALINCO.
ASCII commands for DX-77 are at:
http://www.alinco.com/pdf.files/DX-77_SOFTWARE_MANUAL.pdf

Operation is relatively easy and one could even make a software to
automatically control the DX-77 to your customized operation.

Hi and thanks for reading this posting. Get a great Christmas present for yourself! I have for sale a Very HEAVY DUTY 4 Element 10 Meter Beam. The Beam is made of aircraft aluminum. The elements are 1" and 7/8" which doesn't sag at all. The mast is 2" diameter and 16' long. All the the "U" clamps and hose clamps are all stainless hardware. The gamma tube is cooper, aluminum and polystyrene. It was built it to last. If you are looking for a 10 Meter Beam that will hold up to most all cimates, this is the one. This is "Home Made" following the ARRL Antenna book design but stronger. It was only out in the climate for 3 months and is "Like New". Only reason for selling is that I got a Tri-Bander and don't need this one. Will sell for $150.00 (the materials cost more than this price) + shipping from Idaho Falls, Idaho 83402. You can see pictures of the beam at: http://www.srv.net/~wa4vrv/beam.htm

551. Drake Forum 2001: Raffle of TR-44B

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-12 15:30:42 UTC
From: Sindre Torp <sindtorp@online.no>
Message-ID: <rlF76.876$bA4.3206@news1.oke.nextra.no>
Source record: 66226

Hello all Drake enthusiasts!

This year's Drake Forum will take place at the Dayton Hamvention, Ohio, Saturday May 19, Hara Arena, Room2, 9:45-10:45.

I'm the one who's taking care of it and is the moderator at the Drake Forum this year, but with great help from Don, W8NS and others.

The program is not complete yet, but Robert Sherwood of Sherwood Engineering Inc., and Riley Hollingsworth of the FCC will be there.
And I may have a slide presentation of Drake Protypes and Drake test fixtures etc. - units most people never have seen; if there are any interest? So what' ya say?

There will be a raffle of a Drake TR-44B Communication Station, and the drawing will be at the Drake Forum. Maybe you'll be the lucky winner of a near perfect TR-44B ! Well, you have the opportunity now. For more details and pictures, take a look at http://home.online.no/~sindtorp/raffleTR44B.htm

I hope to meet many of you at the Drake Forum, Dayton Hamvention 2001 !

Sindre, LA6OP

Anytime you're bargaining, it's usually better to let the other person
make the first offer to establish the ballpark range that htey're
willing to consider. If you make the first offer, you run the risk of
asking for too little (or offering too much) and leaving yourself no
room to bargain, or else asking too much (or offering too little) and
having the other person shy away.
```

Source record: 66232

I have an FT-90R and the same thing happens. Warm it up or keep it from
getting cold. I have heard that some LCD displays can be damaged when
operating them below temperature specs. I don't want to take chances.
Disable the auto off feature and leave the rig on. My 706 is cold blooded
also, but better than the FT-90. It is slow for a minute or so. I hold my
hand on the screen for about a minute to warm it and it takes right off.
The back light keeps it warm enough. I only have problems when it gets down
in the teens, so I pop them off and put in pocket. I need to get a leather
stereo case--good ideal.

559. yaesu 8100-r modifications

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-12 16:45:00 UTC
From: Chuck
Message-ID: <t5ud3qpv9de1e5@corp.supernews.com>
Source record: 66233

I recently purchased an FT 8100 R which replaced my old 5200.
The 5200 was modified to transmit on extended frequencies and worked great.
I modified the 8100 as well and as there is no "err" on Tx on 160.XXX, and I am able to transmit to a portable that I am holding, the 8100
barely picks up transmissions on that frequency or transmit very far.

Can the 8100 work on this frequency (as my 5200 did and my old 2400 did)? or does this sound like an antenna problem?

Hi there.
I have just bought a used IC730 without its user manual and am looking for the mike pin diagram (which pin is Mike, which one is PTT and so on...).

Thanks in advance !
And 73 from Lou TK5ML.

571. FS: Island Pack - Soft Carrying Cases for the IC-706/FT-100

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-12 21:40:08 UTC
From: w1wow@aol.com
Message-ID: <20010112164008.28543.00001165@ng-fq1.aol.com>
Source record: 66246

Hello,

I have for sale two soft carrying cases that I designed for the ICOM 706/FT-100 rigs. They are made from heavy duty "Sunbrela" black fabric and the interior is non-rip nylon. The padding is 1/4" foam. There is an adjustable strap that allows you to raise or lower your radio into the bag. There are two opening flaps, one for the front of the radio and one to expose the rear of the radio for connects. The carrying cases have a nylon strap handle on one side and "D" rings with swivel hooks to assist a shoulder strap...

$40.00 shipped Cont. US

Please follow the following address to see my add on the Contesting.com web-page:

Http://www.eham.net/classifieds/detail/13787

I can also e-mail you several pictures!

FWIW, I have a TM-2570 (same radio; different PA) that exhibited the
same symptoms about a year ago. Pulled it out of hiding last week, and
the thing worked. Must have been a loose connection -- I'd check the
PIN diodes in the T/R switching, though. You have the tech manual?

The MFJ 922 tuner handles 2meters/440. It should be at the MFJ site,
http://www.mfjenterprises.com/index.htm

Assuming it would tune your broadcast whip, you'd probably have to
change the output plug to a coax-type.

It might be easier to just remove the broadcast whip, and retrofit the
hole with a Larson 2meter/440 combo whip, and route the cable through
whatever holes your existing antenna uses...

>the pins. Thanks. Reply to larry@sgi.net

sir
are the caps in the mic plug if so
someone might have been tryying to get rf out id say lose them
you sould find a cap or 2 wired in the radio at the mic jack OR you may NOT
pin 1 audio
pin 2 ground
pin 3 ground
pin 4 ground to transmitt
the stock mic was a d104
which colors were
1 clear
2 shieid
3 nc
4 red

pin 2 and 3 are tied together
as a ground in the radio jack

577. Need equipment grounding advice

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-13 01:10:27 UTC
From: Tim Goldenburg <tim@goldenburg.com>
Message-ID: <93o9n4$65e$1@news.jump.net>
Source record: 66052

I'm working on my general license and am trying to determine how to ground an HF rig once I get my license. Unfortunately, my "shack" is on the second floor of a house. It's my office area. I don't really have a choice, so I can't put it down on the first floor. However, my immediate problem is that my common house ground is on the exact opposite side of the house. So what are my options?

Do I stick an 8' ground rod outside my home office and ground my equipment there? It is my understanding that the NEC (National Electical Code) requires that all grounds be tied together. Otherwise, there is a possibility of a voltage potential between the grounds. If this is the case, I suppose I need to run wire around the house to the ground rod? Instead, can I tie the new ground in my garage on the breaker panel which is only 15-20' away instead of the 100-200' to go around the house? Should I get a local electrician to install the ground at my house?

Everyone I talk to has a different story. What's the right and safe way to do it which will minimize interference and maximize safety?

Thanks.

Tim Goldenburg

SONY ICF-2010 Air/FM/LW/MW/SW PORTABLE RADIO
Item #1206432178
Photo & Electronics:Consumer Electronics:Radio: Ham:Receivers

Currently $159.49 First bid $100.00
Quantity 1 # of bids 5 bid history
Time left 1 day, 20 hours + Location Windy City

Sony ICF-2010
covers AM (LW/MW), FM, Shortwave (w/USB & LSB for SSB)& Air
continuous coverage from 150-29999.9Khz, 76-108Mhz, and116-136Mhz
dual conversion receiver with quartz digital synthesis tuning
32 programamble memory presets
tuning: direct entry keypad, memory scan, or with dial
fast/slow dial tuning with lock setting to prevent accidental station change
syncronous selectable sideband tuning on SW to eliminate interfernce on
ajacent frequencies
narrow/wide bandwidth switching
clock w/ 4 programmable timer (alarm) settings and sleep button
LCD read out for frequency, time & memory channel number
green& red led's for battery level indicator and tuning meter
includes: external antenna w/ jack adapter, ac power adapter, sholder
strap, and owner's manual
requires 2 'AA' batteries for memory & cpu & 3 'C'batteries for portable
operation
This unit is in perfect operating condition. Minor cosmetic
imperfections: there is a bit of dust under the display glass, some
small scratches can be found on the unit, and the attached telescoping
antennais missing its tip.

Guaranteed NOT DOA. Buyer to pay actual UPS shipping plus insurance.
Paypal accepted.

On Jan-12-01 at 18:46:00 PST, seller added the following information:

Someone asked about tuning accuracy.

According to page 11 of the manual:
"...frequency is tuned in and displayed at the following intervals,
depending on the bands.
AM: 0.1 kHZ (w/the manual tune mode set to slow)
1 kHZ (w/ the manual tune mode set to fast)
FM: 0.05 MHZ
AIR: 0.025 MHZ"

>
> Thanks!

Hummmm, I don't know all the details, but I think the mk2 had more power on 2m than the original 706. I believe both the first two models had 6 and 2m both, but the first version had a fairly low power on 2m. The mk2 increased the power on 2m to I belive 20-25 watts from 10. "guessing there". The mk2g has 440 mhz which neither of the first two had, and also even more power on 2m. The "g" has 100w on 6m, 50w on 2m, and 20w on 70cm. Also the receiver range goes up to about 500 mhz on the "g". Also, most people seem to think the menus a bit easier, and better audio quality on the "g". I know myself, I can tell quite a difference in the audio between a 706mk1, and a "g". To me, the "g" sounds cleaner and crisper with less "pinchyness". You might look for rig reviews on Eham. "I think thats the name of the website". Obviously, the "g" seems to have the most features, and a more fully refined model of the original 706. I just ordered one myself a couple of days ago. "706mk2g" Eagerly awaiting Mr. Postman....They are on sale right now with a 150.00 rebate. I found one for 899.99. Not too bad considering they were well over a 1000 not too long ago. I'm sure others could fill in more details on the earlier versions. I'm most familiar with the "g" being I've been studying it lately. I'm sure it's a compromise rig compared to the bigger ones, but it will be neat to have longwave thru 500 mhz in one dinky box. I bought it mainly for mobile/portable, but will use it in the house also a good bit I'm sure. There is plenty of info on the "g", at the icom website. I don't think they list the earlier models, so you would have to just search around the net for the others. MK

>
> 73,

Yep, you'll be fine that way. Hummm, I didn't know they made rechargable alkalines..haven't really seen those, but still the same would apply to those. I charge mine right in the 6 cell pack. But I keep a digital voltmeter hooked up to it and watch the voltage to know when to unhook. I've been trying the nickel hydryde batteries lately as a test to see if any good. They supposably have much less of a "memory effect". So far they seem ok I guess...Much better than using a normal AA nicad of the same size. A standard AA nicad does 600 ma. The AA ni-hydes I bought do 1200 ma. Quite an increase in capacity. And you can get them anywhere. I got mine at home depot. They make ones up to 1500 ma or more in the AA size if you look around. MK

Source record: 66059

I am considering putting a 10 meter on the air here in the midwest. Since a duplexer is out of the question (due to size and cost) how far apart would the receiver and transmitter sites have to se to eliminate interference. I probably would use a 440 mhz.link between sites.

Anyone have any suggestions?

Thanks
Chuck

I'm on a few mailing lists so I hear a lot of different comments on various issues the thing that I notice the most is the number of questions people ask about very basic electronics and operating principals. Now maybe the exams are different over there in the states but here in Australia you actually need to know something about electronics before you can get a license.
So maybe its already gone the way of CB over there.
ANYWAY thats not the point. Too many people realise one thing. The number of active Ham's world wide is falling there are to many other hobbies and its way to easy to communicate with some one around the world on the Internet. If we start loosing to many numbers then there will be less argument for the governments to take away our rather generous band allocations for the all to frequency hungry communications industry.
Frequency is real estate and we currently are leasing a hell of a chunk of it!!
I'm all for making it easier for people to get into the hobby and its up to all of us to educate and help those people on what is right and wrong. If some one wants to be stupid they dont need a license to do it!

Cheers
Eric.

Basically, in running a ham radio station, you have three types of grounding that can be used.#1 Safety grounding in the shack for the gear, #2 an rf ground if needed, #3 grounding for lightning protection. They each satisfy totally different jobs. So #1, if anything you have in the shack plugs in the wall and could be a shock hazard, it should be grounded. This is usually done using the ground pin on the gear plugging into a socket with a properly installed ground wire. This satisfies the safety ground. #2 The rf ground in the shack is only needed in the case of a random wire fed directly from the shack. With ANY complete antenna with proper decoupling from the feedline, NO rf ground is required in the shack. This would include most any normal antenna such as dipoles, verticals with proper ground/radial systems etc. So if you have a complete antenna fed properly, you don't need an rf ground in the shack. Doesn't that sound easy? :) In fact, using one in a case like yours will likely cause more grief than good. It won't act as a ground, it will act as half your antenna in many cases. Bad news, unless you like rf problems. In the case of an antenna such as a vertical where you need a rf ground, it should always be at the antenna, not the shack. Except in

the one case I mentioned feeding direct from the shack using a tuner etc.#3 As far a lighting grounding outside, again follow NEC, bond all grounds together, and use suppressors etc if needed. Polyphasor has info about lighting grounding on their website. You want all grounds at the same potential, but you also want to make as good a connection to the earth from your mast/tower etc as possible. You want to direct the strike to ground with as little resistance as possible. If you do that, you have 80% of it licked. The rest is taken care of with suppressors, or just grounding all antennas out during storms. Preferably outside. I've taken a direct strike to my mast with no damage at all, but I was grounded out, and no connection at all from the shack to the outside. Being as I use no rf ground, I have no direct connection with the outside lightning grounding if I unplug my power to the rigs. I prefer it that way. So to sum, in my opinion, and yep your right there are many... I wouldn't waste the time using a ground wire. There is no need for it at all in your case as long as you use a proper antenna setup. The lightning grounding should be at the mast, and also a bulkhead at the entry to the shack if you want a place to ground suppressors or use so-239's and manually ground. Both bonded together as in NEC specs. MK

596. Delta Electronics RAS-10A antenna-comments?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-13 10:54:19 UTC
From: tf.electronics@virgin.net
Message-ID: <3a603072.808907@news.virgin.net>
Source record: 66071
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.shortwave

Hi,

Recently, I have been reviewing my home antenna system and I have decided it is time for a change.

A friend mentioned to me that Delta Electronics make a wide band antenna called the model RAS-10A which covers 1-30MHz, in a span of only 40 feet. I believe it could be used for transmitting as well.

This antenna seems to have no traps and it isn't a fan type of dipole, there are no loading coils or linear type of loading either. Instead, there is a prominent "balun" in the center of the antenna, connected to the feedline and the two legs of the antenna.

The question is how does it work? How CAN it work? I seem to remember a few years back an antenna which claimed similar performance in small size yet when it was checked out by QST it was really a short dipole with a mysterious circuit board and a large resistor! It certainly was 50 Ohms at all frequencies but didn't radiate too well. I'm certainly NOT suggesting the Delta Electronics antenna is like this though!

So does anyone have any experience of the Delta Electronics RAS-10A? I'd be interested in your comments before I pursue the matter further.

Please reply to: tf.electronics@virgin.net

For some freakish reason, some one on Ebay decided my 2 meter all mode was a piece of illegal eqpt. Then Ebay in its infinite wisdom cancelled the auction. Anyway, I had it listed at $185. It is a great rig with absolutely nothing wrong with it. It has internal ps, ssb, am, cw, fm capabilities. I am reducing this rig to $165 + shipping. I am selling for my father in law who wants to upgrade to a 706. I promise you would not be disappointed in this rig. Pls email for pics and / or questions.

Bill

Source record: 66081

I tried over in the boatanchors group first, but no response, thought I would try over here... I'm looking for any information on this radio.

I bought this radio about 5 years ago at a hamfest, and I never really looked at it, typical impulse buy. It is a 20M 20W monoband radio with CW and SSB. It is marked "Amp Supply Co. and TR-120, looks like early 1980s vintage. I have a feeling that this was rebadged from some other manufacturer; does anyone know who that was or where I can find any information on this radio?

Here is a picture of it...

http://webpages.charter.net/bbiggers/DSCN5018.JPG

I have used both the original and the Mark II primarily on CW with the 500 Hz filter. It works quite well. The Mark II and Mark IIG both allow two filters to be installed.

email back from ebay abt 2 meter all mode
Subj: WARNING: eBay Auction Cancelled by Customer Support
Date: 1/12/2001 5:46:09 PM Central Standard Time
From: ended@ebay.com
To: aokd5fxt@cs.com

Dear Bill Reed (aokd5fxt@cs.com),

eBay appreciates the fact that you chose to list your auction:

1206474562 TWO METER ALL MODE BASE - YAESU FT221R

with us. Unfortunately your auction was in violation of one or more of our
listing policies. eBay does not permit the listing of CB Radios that are
amplified to exceed 4 Watts using the AM Settings or 12 Watts using the SSB
settings.

Please view our guidelines for listing this type of item on the following page:

http://pages.ebay.com/help/community/png-scanners.html

Please view our guideline page for a better understanding of our auction
policies and how they affect the way you list your items:
http://pages.ebay.com/help/community/png-list.html
For information on infringing, prohibited or questionable items, please view:
http://pages.ebay.com/help/community/png-items.html
For more information on why eBay has ended an auction, please visit:
http://pages.ebay.com/help/community/png-endauction.html

IMPORTANT NOTICE: Please be aware future incidents of this nature can lead to
the suspension of your account. We value you as a member of our community and
wish to continue this relationship, so we must ask you to refrain from any
violations of the Listing Policies or User Agreement in the future.

We thank you in advance for your cooperation.
Please feel free to contact us with any questions or concerns you may have on
our existing policies.

Regards,
Burt eBay (ended@ebay.com)

The charge today can be up to $10 per fcc regulations.
The limit is $10 though. It was $6 when I got mine 7 years ago roughly,
course that VEC didn't charge the full rate, I think the max they could
charge was $7 or something.

Tim,

I would refer you to the ARRL antenna book or handbook. Someone in your community of hams or your local library should have a copy. If you cannot find, e-m me at kb5hxt@arrl.net and I will see what I can send you. I don't want to infringe on copyright law, so please try to find them locally. I ground my shack rf/lightning separate from my electric service.

You want to reduce the chance of electrical shock if your equipment should fail, so you ground all radio cabinets, this is your "dc" ground. You want to provide a low impedance path to ground for any stray "rf".

I hook all of my equipment's ground lug to large copper wire, hooked to a buss bar, just a piece of copper, connected to braided copper wire braid that goes out through my wall to an 8 foot ground rod.

If your station is staying on the second floor, a second system might provide better "rf" protection. A 1/4 wave radial for each band you operate on should be hooked to your transmatch. Please see documentation for this as I live below ground myself. I also ground each coax that comes into the shack and disconnect from the radios and connect them to a bus when not in use that goes to ground.

Hope that helps. 73 de kb5hxt, Mike

Yeah, you've just got to quit trying to sell those 2 meter CBs! Jeez, when are those idiots going to learn?? I bought 2 Regency VHF 75 watt amps from a guy after they were kicked off ebay as their policy prohibits selling amps that can be used on CBs and driven with 4 watts or less. These amps were made for TWENTY watts input at 155 MHz!! I wonder who reads these ads and makes the decisions?

> And 73 from Lou TK5ML.

8 pins of course. pin 1 is mike audio hot. Includes a voltage to run a eletret mike if needed. pin 7 is the ground braid for the audio hot line. Pins 5 and 6 are the PTT. If you wire the same as stock , black goes to pin 5 and red to pin 6. Also be aware that the 730 needs a mike preamp in order to have enough drive. I have two or 3 circuits that can be used for this if needed. You can also rig up up/down buttons for the mike, but will need switches and a I think 470 ohm resister, but I don't use that too much. If you can find one, the HM-7 is the hand mike for that radio. The SM-5 was the factory desk mike used . Need any other info, let me know. I ran a 730 for years, and still have it, but it pooped on me and I can't find the part needed yet. "Looking for a junker 730 for parts". It's a great radio. I think you will like it if it's working right. I had no trouble with mine at all for a long time. MK

Thats the result of the fcc jumping on them about illegal cb amps which
were being sold. Obviously, they aren't aware thats not a cb...I wonder
if they do not allow 2m rigs anymore???MK

626. ICOM IC-745 Schematic?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-13 20:47:40 UTC
From: Keith McQueen <kb7m@arrl.net>
Message-ID: <J9386.1126$D01.342751@news.uswest.net>
Source record: 66152

I have been asked by a friend to repair, if possible, his ICOM IC-745 HF rig. It seems to have a frequency stability problem (at least!). The receive frequency varies up and down rapidly (over the course of a few seconds). It is especially bad while warming up. Even after warm up, a CW signal from a service monitor appears as a warbling tone.

I do not have any documentation for this rig. Does anyone have a schematic that they could copy for me? Has anyone experienced this sort of failure in this rig? Any suggestions?

Ok i read the e-bay policy at
http://pages.ebay.com/help/community/png-scanners.html
What part of this policy did he violate????
Could it be that burt at E-bay is clue less? and doesn't know what he is talking about?
e-bay is suggesting that KD5FXT's radio is somehow illegal.

Also, why the blanket banning of amps that work from 24-35 MHz?
There are legal amps for this band. just look at all the fire trucks ,and ambulances on 33.XX and surplus military gear that operates that operates on 32.xx MHz.

Sounds to me like E-Bay doesn't know what they're talking about.

Dan AI8O

By the way how much do you want for the FT-221?.

chris
i dont know of any websites but if you buy an ARRL antenna book it will
have everything you need to know about building antennas in it
as for the CB whip on 2 meters its way to long if its a short one then
it has a load in it that would make it impossible for use on 2 to make a
`/4 ant for 2 all you need it a piece of stainless steel wire about 20
inches long and a 3/8ths 24 thread bolt about one inch long then bore a
hole in the top of it big enough to slide in the wire then secure it how
ever you wish
then that will screw right into any CB type mag mount

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

The 850SAT is in excellent condition and comes from the shack of a silent key from two years ago. It has no filters and is serial number 60M plus. I tested it and it works perfectly and is in mint cosmetic condition. I have the manuals, mic and power cord, but not box (they can't find it or haven't yet, so if it's located, it will be in there).

The price is 850 plus shipping and insurance (if you desire).

Also have a Radio Shack 202 HT with charger, extra antenna and cig adapter and manual for 75 bucks plus shipping and insurance (if desired).

These will be going to the Richmond Frostfest on Jan 21, so if you are interested, you must purchase before then. Price will go up at the Fest.

There is also a Hammarlund HQ-110 receiver with speaker and manual,
a WRL Globe Scout and manual,
HeathKit VFO and Heathkit Q Muliplier and manuals and a
Hallicrafter Sky Buddy. There are power xformers and cables too. Would like to sell this all as a group.

Thanks and all proceeds go to the widow of the ham.

Pat

Can you post the exact text of your ebay auction posting? Did you
mention anything about mods etc...

You can email ebay support, I've gotten help before. Use this form:

http://pages.ebay.com/help/basics/select-RS.html

Hi:

I have located a Brand New RTX4005B Series Motorola Portable Test
box that is used for detailing Motorola HT's

A photo can be seen @

http://www2.4dcomm.com/metrotech/r4005b.jpg

From Motorla, wholesale is over $400.00

$235.00+8.00 for Pirority Mail Shipping, Handling, Insurance, Tracking
==========

I also have a RTX4005A if you do not need the B version for 145.00, and can
supply the parts required to make it a "B: version for $40.00 extra ($65.00 if
you just want all the parts to convert a Existing RTX4005A to a RTX4005B

If you wish for me to make the upgrade, I will do that for 15.00 extra making a

total of 200.00 if you desire a upgraded version.
==========

I also have a spare MX / STX Service cable for the above for 50.00+S&H, or
40.00 with the purchase of any of the boxes above.

Terms:

PayPal Now Accepted !!

Acceptable PrePayment in the form of a Postal Money Order, PayPal (If
immediate shipping is desired) or a Personal / Business check is A-OK too if
you do not mind a Short Shipping Delay due to bank processing time. This is
required only the first time or two as once you are in the data base,
PrePayment is no longer required

Source record: 66167

Hello all,

I've got a very good condition Ranger 2950 with all the mods, bells and whistles.. This radio will do 10 meters AND CB.. Awesome rig, just don't need it now that I have a 706. I'm looking for an HF Outbacker antenna that will handle 6-80 meters or thereabouts.. Other antennas will also be considered.. Let me know what you have and what it would take to make this deal happen.

Thanks and 73,
Paul Jordan

Source record: 66168

For the ICOM IC-2410H dual bander:

VHF band deviation control is R5 on the Main A board.
UHF band deviation control is R7 on the Main B board.
PL deviation looks like R3 on the UT63 board if your radio is a
USA model.

My 706MKIIG truncates dit's when using full break-in above about 25 - 30 wpm - otherwise very good. The QST review (which I can't find!) confirmed this observation.

The receiver is a bit ordinary compared to larger rigs (and TS50).

> alkalines..haven't really seen those, but still the same would apply to

Yeah, they're made by rayovac I think. At any rate, they're called "Renewals." They work really great in flashlights. I work at an observatory and we go through a lot of flashlight cells (D batteries). We tried NiCd a long time ago, but everyone hated that because you'd be outside and w/o much warning or time to get inside, the flashlight would go dead. Last year we started using these "renewals" and they are really great. They behave just like an ordinary alkaline battery; same discharge curve. I really don't know why you can charge these and not "regular" alkalines. You can find renewals in just about any hardware store, I would guess. I think I bought these at OSH (Orchard).

BTW, thanks for the other info you gave about using rechargables in your alkaline pak.

R7 is located on the topside of the radio,
adjacent to a large shielded box,
a few inches behind the volume knobs.

The UT-67 is the CTCSS decoder option.

Source record: 66177

David Snyder Hale <david@isi9.mtwilson.edu> writes:
>I just got an alkaline battery holder for a Yaesu FT-51R.
>It says not to use rechargable batteries in it. Why is this?

One reason is that it contains no protective devices. NiCd AA cells
can source tens of amps when shorted. If the short continues for any
length of time, it can overheat conductors or the cells themselves.
So NiCd (and NiMH) cells contain some sort of fuse or circuit breaker
to protect against the contacts being shorted accidentally. Individual
NiCd cells in the Yaesu pack have the same current capability, but without
the breaker/fuse.

The pack is designed for alkaline cells, which have enough internal
resistance that they're not particularly dangerous even when shorted.

>How about "rechargable alkaline" batteries? (ie. rayovac renewals)

They have even more internal resistance than standard alkalines, and
should be fine.

Walt Davidson <junkmail1@redhotant.net> writes:

>What's the matter with you? He said £180 ono. Is that not good
>enough for you?

Probably character set mixups.

The original article used a pound symbol, but the whole article was
posted using MIME encoding. In addition to looking ugly as hell to
people using plain-ASCII readers, the line with the price in it looked
like this:

=A3180 ono.

which doesn't look like a price at all.

Walt's reply has a different problem. Walt obviously read the message
with a MIME-capable reader that turned the magic sequence above back
into an ordinary character for him. But when he posted his followup,
he didn't use MIME format, and the pound-symbol was transmitted as
an 8-bit character. This probably worked for a bunch of people,
but appeared wrong for some others. I read it on a terminal emulator
on a Windows box where it worked.

But when I quoted the message to write this reply, the Unix-based
editor displays the price to me as "\243180 ono" - equally silly.

The lesson (if any) in all this is that if you use anything other
than plain ASCII, or if you use MIME encoding, some readers simply
won't see what you wanted them to see.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

They are not hams. So can't be expected to know all the rules. The FCC
gave them a good tweaking recently because of the sale of illegal amps
on e-bay. You can't sell amps that operate from 24-35 mhz, no matter who
can use them. They are just protecting themselves against future
problems. Can't really blame them for that.
After knowing the facts they reinstated his auction. MK

String up a dipole. No need to waste money on those high priced verticals. Alot depends on what bands you want the best performance on also. A multi band dipole will generally be the pits on the low bands. Ok, on the higher ones. A good 130 ft dipole fed with ladder line and a tuner at the shack can work any band 80-10 with good efficiency. The tuner would probably be a better investment than a high priced vertical as you can use it with many antennas etc. You can also feed single band dipoles with coax directly. Or parallel dipoles and feed with coax. Verticals are nice too, but I prefer to build them myself. The prices on the commercial jobs is pretty steep for what you get. MK

Hi, I'd like to have a spare pair of true Eimac 3-500z tubes, they don't need to be electrically matched. They don't even have to be new as long as the output is full and normal. What have you got?

Yes, I know I can get them and other brands from the RF Parts, etc, but they are a bit out of my budget.

Thanks!

Neil, K1VY

> 73,

I've been charging the NH batteries at a pretty good clip lately. About
.3 C or so. .1 C being the normal "15 hour" charge rate. I use a little
homebrew charger that is made out of a truck clearance light...g I can
change the bulb at whatever charge rate I want. I have a bulb for .1 C,
which is about 120 ma for the 1200 ma pack. But lately I've been rushing
things a bit and charging at about 375 ma. I have a bulb that will do
475 ma if I'm in a hurry. It's easy to tell when a NH battery is full
charge. You have a slight voltage drop. The higher the charge rate , the
more pronounced the drop. So I just let it peak, and when it drops .01
volt, I unhook. But I do have to keep an eye on it. I can put in a low
rate bulb if I know I might have to leave or something. MK

Well.....a hundred possibilities but I looked at one of those a few weeks ago and it was merely the mic cord broken right at the plug.

Easy enough to check.....and you can verify by keying the CW lines at the rear as well.

For a older radio that is going cheap, I don't think you can beat the
old 520's. Great audio quality. Nearly bullet proof, and easy to work
on. Of the course the other hybrid kenwoods also good, but generally
cost more.
IE: 820,530,830, etc. You can find the solid state TS-120's and 130's
pretty cheap. They are pretty good, but tend to drift a bit sometimes.
The Icom IC-730 can be had for anywhere from 250-350$. It's probably the
best radio you can find for that price that is totally solid state. It
doesn't drift enough to worry about, unless you stick it in a cold car
and then turn the heater up on it..Also you see some pretty good deals
on the old drake gear sometimes. It's pretty good too for the older tube
gear. Actually, as far as the 60's-70's "pre-kenwood 520" gear such as
drake, collins, swan, etc, etc, only the collins and drakes do I really
still consider good radios for modern day use. The rest too obsolete and
drifty. But a collins or drake still quite usable. MK

Sue the b.....s, I really mean it, this way they will be forced to find
out what is amateur radio and what is CB.
I will donate some money if you make a good effort to sue them.
Ask others to participate, you have an excellent chance to teach them
what is legal and what is illegal.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1206432178
SONY ICF-2010 Air/FM/LW/MW/SW PORTABLE RADIO
Currently $182.50 First bid $100.00
Quantity 1 # of bids 6 bid history
Time left 2 hours, 27 mins + Location Windy City

Sony ICF-2010
covers AM (LW/MW), FM, Shortwave (w/USB & LSB for SSB)& Air
continuous coverage from 150-29999.9Khz, 76-108Mhz, and116-136Mhz
dual conversion receiver with quartz digital synthesis tuning
32 programamble memory presets
tuning: direct entry keypad, memory scan, or with dial
fast/slow dial tuning with lock setting to prevent accidental station change
syncronous selectable sideband tuning on SW to eliminate interfernce on
ajacent frequencies
narrow/wide bandwidth switching
clock w/ 4 programmable timer (alarm) settings and sleep button
LCD read out for frequency, time & memory channel number
green& red led's for battery level indicator and tuning meter
includes: external antenna w/ jack adapter, ac power adapter, sholder
strap, and owner's manual
requires 2 'AA' batteries for memory & cpu & 3 'C'batteries for portable
operation
This unit is in perfect operating condition. Minor cosmetic
imperfections: there is a bit of dust under the display glass, some
small scratches can be found on the unit, and the attached telescoping
antennais missing its tip.

Guaranteed NOT DOA. Buyer to pay actual UPS shipping plus insurance.
Paypal accepted.

On Jan-12-01 at 18:46:00 PST, seller added the following information:

Someone asked about tuning accuracy.

According to page 11 of the manual:
"...frequency is tuned in and displayed at the following intervals,
depending on the bands.
AM: 0.1 kHZ (w/the manual tune mode set to slow)
1 kHZ (w/ the manual tune mode set to fast)
FM: 0.05 MHZ
AIR: 0.025 MHZ"

GE MP-A VHF 146.-174. 160 channels Aegis digital encryption w/ battery and charger 9-9.5 condition. works great I use it daily. $375.00
GE MP-A UHF 440.- 470. 192 channels. w/ battery and charger an 8.5 $275.00
GE MTL VHF 16 channel scan. With battery and charger about an 8. $150.00
GE Monogram SP2550 VHF ex CSX radio with battery and charger $125.00
GE NPC200 UHF 16 channel scan with battery and rapid charger. New Uniden case. Radio works and looks new. $150.00
GE MPI 2 UHF 2 watt 2 channel programmable radio. I have 3 of these all programmed to the same GMRS split and talk around. all have chargers and good batteries. $65.00 each or $55.00 each for all 3.
Vertex VX500 UHF 32 channel scan with battery and charger. $200.00
GE Master 2 UHF 75 watt. with pre-amp and all accessories. No Icoms $125.00
GE Master 2 UHF 40 watt repeater in a Desk mate case with GE controller. No duplexers. I will add a UHF Master 2 75 watt for parts with the station that way you can make it a 75 watt with a pre-amp. $700.00
Motorola MX300s software adapter for the 1801 suitcase programmer. part number RTL5805C. $200.00
GE Master exec 2 Mobile repeater. VHF radio with a UHF receive section. with your choice of a Master 2 or a delta cable. $20.00 I have several of these.
GE Voice guard 9600 series encryption boxes. $20.00 I have several of these.
Motorola Micor VHF 110 watt mobile. drawer only. make a repeater. $25.00 ea.
GE Mobile Vehicle charger. Turns the MP-A, MPD, MTL, and TPX into a mobile radio and charges the battery. Comes with the mic, speaker and wiring harness. this is my personal setup so I know it works. Price with one of the above radio's $100.00 if purchased separately $125.00
GE MP-A, MTL, MPD, and TPX speaker Mic's new in the box with all paperwork. $35.00. I have 2 of these. I also have 1 used Public safety speaker mic for $35.00
Motorola thruline wattmeter with 5 watt 500 - 1000 MHz element $60.00
Marconi UHF portable HT 16 channel. Looks like a standard. I powered up with a power supply and the thing works and has good sensitivity. No charger so I do not know about the battery. about an 8.5 $75.00
Ritron Responder Repeater. With service manual, mic, and power cord. 10 watts out with built in duplexer, needs no power supply uses 110 AC on 462.700 $375.00
My terms
Shipping is the responsibility of the buyer on all Items. All Items sold as is but Portable radio's will not be DOA. I will not cover return shipping but will pay to ship a replacement if I have one. I can have the above radio's programmed ask about price. Trades welcome just ask.
Wanted Items
4EX22A10 mini e-prom programmer.
TQ3330 Delta ranger interface.
TQ2310 suitcase programmer if I can trade above items for it.

Dual band mobile ham radio's. UHF mobile ham radio's
Cash also works

>Everyone I talk to has a different story. What's the right and safe way to
>do it which will minimize interference and maximize safety?

Mark Keith gave you excellent advice. Electrical safety grounding is
handled by the third pin on the AC cords for your equipment. You may
want to tie other boxes in your shack that aren't directly AC powered
to this power safety ground too. Do that by designating a *single point*
in the station and grounding all the boxes to it, then ground it to the
power ground. (Using a single point grounding technique prevents
ground loops which may introduce hum or other problems into your
station, never use buss style grounding.) The purpose of this grounding
is to prevent a shock hazard in the shack. Your house wiring already
provides you with this ground, so there's little you have to do to use it.

RF grounds are unnecessary in the shack unless you're end feeding
a random wire directly from the shack (my advice on that is *don't*,
unless you have no choice). RF grounds, IE counterpoise grounds,
are needed only at the *antenna feedpoint* of unbalanced antennas
like verticals fed against ground, and aren't needed at all for balanced
antennas like dipoles. (A choke balun is desirable though, to prevent
common mode currents on the coax shield.)

You don't want RF grounds scattered elsewhere in the system because
they'll simply be paths for unwanted common mode currents, and will act
as unwanted antennas that'll mess up the intended pattern of your actual
antenna. They can cause interference problems too.

***If you have stray RF flowing around, find out why and *fix the problem*.
Do not try to bandaid it with helter skelter RF grounding. That is never the
correct fix, and often creates other problems. ***

Lightning protective grounding is an entirely different and very complex
subject. The main thing you want a lightning ground to do is to provide
a controlled path for the lightning discharge. As such, it should be as
direct and as low impedance as possible from the point of the strike to
Earth.

If you use a tower or metal mast to support your antenna, that should be
directly and extensively grounded as it will likely carry the brunt of the
strike. A single ground rod is seldom sufficient. You need several, spaced
about 16 feet apart to avoid ground saturation effects, and configured
star fashion, in order to provide a sufficiently low impedance connection
to Earth (a large buried radial system will work too, in fact it is often better
than driven rods).

The lightning downlead should be direct and as straight as possible. Any sharp bends will increase inductance and elevate the potential of things above the bend during a strike.

If you use coax feed to the antenna, that should be brought directly down to Earth, and supressed there with a good quality lightning suppressor (Polyphaser products are excellent.) to the good Earth ground described above. Then the coax can be routed to the shack. This is critically important. Do not just swing the coax overhead to the shack. It may be shorter and more convenient, but it will also be sure to bring elevated potentials into the shack during a strike.

Example, if you have a Rohn 25 tower, properly grounded, and you swing your coax off of it at the 10 foot level to go over to your shack, the shield of the coax will assume a potential of 20,000 volts during a strike due to the inductance of the tower section below the swing off point. Don't do this! Even if you have suppressors in the shack, it is likely that some damage could still be done. Bring the coax right down to Earth, suppress it, *then* take it over to the shack.

Now if you religiously disconnect, and throw out into the yard, any cables leading into your ham shack when lightning is likely, the above steps are sufficient. But if you want to leave things connected when there is a possibility of a strike, you'll have to take further steps. The key step is to create a *ground window* at the shack entrance.

Every cable that enters or leaves the shack area *must* pass through this window, and be bonded or suppressed to it as appropriate. This ensures that all wiring attached to your equipment (or routed near enough to your equipment to side flash) will be at the *same* potential during a strike. No potential difference, no damaging strike currents can flow.

Now when I say *every* cable, I mean *every* cable. That includes the AC power feed for the shack, telephone wiring if there's a phone in the shack, CATV wiring, etc, etc, etc. If you miss *just one*, the ground window offers you no protection. But properly done, you can ride out direct strikes while continuing to operate. (This is the way good broadcast plants are done, they can't afford to shut down during storms.)

If you want this level of protection, there are a myriad of details which have to be done just right. We can have more extensive discussion of that, I can recommend some books, or best of all you can hire a specialist in lightning protection to design and install the system for you.

(There are only a handful of qualified specialists in the country, however. I occasionally do work for a PE who is one of them, and consider myself pretty knowledgeable in lightning mitigation, but he's the PE, not me. You're responsible for any liability unless you pay him and he signs off on it.)

>instead of another 1/3 the cost....well I am happy that I passed my
>Test!!they can have my Money now that I am a General...
>ohh better say / AG for now...Mike KC6 RDJ

Congratulations on the upgrade.

The FCC raised the maximum permissible fee at the first of the
year to $10. The VECs don't have to charge you *at all*, but if they
want to, then $10 is the maximum that they can charge.

The ARRL VEC went to the maximum charge right away,
some others didn't. It does cost the volunteers and the VEC
office to run the examination program. We shouldn't begrudge
them $10 for all the work they do.

At least we don't have to drive to an FCC office to take the test
anymore. (Good thing too, recent staff cutbacks at the FCC have
closed a number of the offices, so it could be a *long* drive for
some of us.)

685. Re: power supply question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-15 00:03:10 UTC
From: Ted Bruce W2ICV <>
Message-ID: <n4f46t0fhji54lpnf2meupja6o3lti0nbf@4ax.com>
Source record: 66110

The linear power supply has few parts, and only one of them is critical (expensive). That is the power transformer. It is a passive device, and assuming that it is properly fused, should last for decades.

The switching supply has many critical parts. Basically, all parts are critical. Failure of any of them is hard to diagnose. Catastrophic failure could occur more frequently, due to the high parts count. Transistors (IC or otherwise) are susceptible to transients, heat, and other failure initiators. If the supply fails out of warranty, good luck in trying to repair it.

686. Help! TS-430S Band problem

I've had my TS-450SAT for 5 years now and love it. Excellent radio.
Use it far more than my Icom-706MKII but that's a real nice rig too.
It would probably run about $600-$700.

I also have had my Kenwood - TS450S / AT for going on 6 years since buying it new in August 1995. It has been a real workhorse and has never given me a moments trouble. For the past 18 months it has been the exciter for my Ameritron AL-811H and continues to perform well.

To my knowledge they have not yet shown any failure patterns such as the TS440 vco potting trouble which has been well documented. You should be able to snag a nice 450 for $650-$750.

Well it looks like its that exciting time when all the manufacturers
are coming up with new toys!
If mimicry is the best form of flattery then Icom can't pay any more
compliments to Yaesu then it has with this new little toy.
Lets hear what you think of it. 6m,2m and 70 cm, 0.495-1319.995MHz RX.
Lithium Ion battery and it's small.!!
Even looks like a VX-5.
I've just got to get one!! and see what it compares like. Wish I could
read
Japanese
http://www.icom.co.jp/index.html

Come over and join the new e-group at
http://www.egroups.com/group/IC-T82R

It would be really good if people could get some people from Japan onto
the mailing list so that we can get more first hand info, every one
please help!
I'll try and get more photos and translate the spec sheet so stay tuned
to the files section.
See you there cheers
Eric.

This is a very shortsighted view. As in my previous post if we keep loosing operators we will all loose the ability to use code and phone and every other single frequency we have the pleasure of using. Just becuase you dont need to know code doesn't meen you are not allowed to use it! I cant see why you would sell out your hobbie and your friends! This is a time when we all need to stick together and the more of use there are the better for the hobbie as a whole. We should all take it upon our selves to be good operators and help those less fortunate. Like I said any CB'r can modify a CB and make a nusance of them selves but people still need to know stuff and be responisble to get a license.

Cheers
Eric.

Yeah, we wouldn't want any loose operators on their hobbie horses!

Why? Just becuase it would be meen and there needs to be more of use to be
a nusance rather than responisble people.

701. FS: Kenwood TS-940SAT HF Transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-15 07:06:50 UTC
From: Rick Riverman <rbriver@home.com>
Message-ID: <ekx86.265437$U46.8552761@news1.sttls1.wa.home.com>
Source record: 66127

FS: Kenwood TS-940SAT HF Transceiver:

- Serial number: 9090002 (late model with all the mods)
- Built in automatic antenna tuner
- YK-88C-1 CW filter ($88.00 from InRad)
- YG-455C-1 CW filter ($155.00 from InRad)
- Full service manual
- Operation manual

* Continuous receive from 100KHz-30MHz
* 160 through 10 meters transmit LSB, USB, CW, AM, FSK
* Dual VFO with A/B split band operation
* 10 meter FM with offset capability for repeaters
* 100 watt output all bands
* Auto tune any band in less than 20 seconds
* 40 memory channels
* Digital clock and auto timer
* I/O for PSK31 (uses the phone patch ports)
* Friction adjust for main tuning dial
* Built in power supply
* Many more features...

This is arguably the finest radio ever built by Kenwood.
I don't know of anything better for CW operation. Signals are
crystal clear using the above 400 Hz filters. SSB bandwidth can
be easily shaped and notched to bring you only the signal you
are looking for. 10 meter FM works as easily as your mobile rig.

All for $850.00 + shipping from 97006 (approx 50 lbs.).

Thanks,
Rick

>radios with "mod"s aren't listed?

No, most likely vigilant hams not wanting cber's to transmit
out of band or to use excessive power on 11 meters.

I don't blame them.

They look for mods, extra channels, tweaked, special features
and other words reflecting a modified radio.

Source record: 66132
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hi there.

HOW ABOUT a LINK to the NEW CRYSTALS swapping BBS?

There is a NEW Crystal Exchange Message Board (free) on the
web at:

http://senac.com/boards/880/

There you can post sale & want ads and find radio crystals for sale
by others!

Sell your excess crystals there!!

The previous old message board was being ruined by Taiwanese
infiltrators that ruined it with off-topic SPAM ads. This one is
secure.

The above is all hobbyist and non-commercial. OK, the BBS has
sponsor ads, that is how we get it free.

I have concentrated all of my HAM LINKS
efforts over the past few years to editing the Open Directory
system, and I am the editor for all of the Ham Radio
BOATANCHORS links on there.

I like the robot that automatically removes any bad links for me!

We have a broad variety of specialty links to over 700 sites
(arranged by category) of interest to hams who enjoy antique rigs.

Please also link to:

http://dmoz.org/Recreation/Amateur_Radio/Boatanchors/

About a week after i posted the original message,
i went out and bought a traditional/linear power
supply (Astron RS-35M). There were enough comments
(newsgrp & email) against switching power supplies
to sway my mind. Needless to say, i'm quite pleased
with my purchase (so far).

720. FOR SALE: Kenwood VFO-240 Remote VFO

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-15 22:38:37 UTC
From: k8mfo@aol.com
Message-ID: <20010115173837.11005.00001882@ng-mc1.aol.com>
Source record: 66146

I have a nice Kenwood VFO-240 remote VFO for sale. This is used with the TS-830 and some other Kenwood transceivers to provide for split frequency operation. All lettering is clean and crisp on the front panel, which has no scratches. There are minor mars on the cabinet, but the unit looks very sharp, inside and out. Works just as it supposed to. Have the manual and cable to connect to the transceiver. Will ship the unit anywhere in CONUS for $130.

Questions? Don K8MFO

721. Re: power supply question

Source record: 66147

The Astron is a fine supply. I have one of the 50 amp models and have used several other models over the years. About the only 'problem' with them is they will sometimes go into the over voltage protection mode if the AC power is cut off and on veryfst such as sometimes during a thunder storm. Mot much of a problem at home, but it was a real problem at a repeater site. Just wanted you to be awear of that problem . Just cut it off for about 30 seconds and then cut it back on to clear the problem.
Saw a circuit that is suspose to cure this problem somewhere, but forgot where.

722. FS or TRADE: Kenwood SM-220 Station Monitor

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-15 23:43:56 UTC
From: Rick Riverman <rbriver@home.com>
Message-ID: <0XL86.269541$U46.8620035@news1.sttls1.wa.home.com>
Source record: 65998

Unit is in very good condition.
Works well, no blemishes or scratches.

It does not contain the BS-8 Pan-display adapter.
There is no manual, but the moniter is very intuitive to operate and manuals
are readily available.

$195.00 plus shipping from 97006

Or I would consider a trade for an older HF rig or a newer 2 Meter mobile or
440 MHz mobile. Perhaps an ADI-600 HT?

Thanks,
Rick

re: Bad Guy Alert : Scott D Macheichok, KG9HY , an Amateur Extra.
==========

Hi All,

Want to warn you about Scott D Macheichok, KG9HY , an Amateur Extra.

I bought a Yaesu VX-1R from him back in Mid - June, 2000. He sent me the radio after some delay and the package was missing a speaker mike and leather case. He has promised over and over and over again to send me the missing items, up till now, Jan 14, 2001, I still have not received it. Below is his last promise and I still receive nothing but lies. My follow up email
were un-answered, of course.

I thought others should know about this and be careful about dealing with this Amateur Extra, Scott D Macheichok, KG9HY . I am not an Amateur Extra but this is definitely a bad apple. I know my loss was not much at all and I thought about forgetting it. But imagine if a guy can cheat you for a lousy $40, he is likely to cheat you for more if there is a chance. BE CAREFUL.

73 .....

739. Translating DB Gain to Sensitivity

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-16 08:55:45 UTC
From: kbucher@access.mountain.net
Message-ID: <3a640c91_2@News.Mountain.Net>
Source record: 66015

How do you translate DB gain in to sensitivity? Here is my
situation.
Here are the medium wave sensitivity specs for the Kenwood tS-570:
Sensitivity: AM (S+N/N 10 dB) Less than
31.6 ÿV (500 kHz ~ 1.705 MHz)
Now for the sake of this discussion, let's say that it is 31.6 not
less than 31.6 so we'll have something concrete to work with. Now
there's a jumper in the tS-570 which removes the 20DB attenuator from
the MW band. So if you had a 31.6 sensitivity rating what would the
sensitivity be if you increased it by 20DB?

Speaking of sensitivity, does anyone know if such a jumper exists in
the Kenwood tS-2000? Thanks for any help.

Keith

Your sensitivity should improve to about 3uV, when the attenuator is
removed. I could be a little off on this one, so feel free to correct me.
I DID change the jumper position, and the MW performance is now pretty
similar to my AOR-7030.
A little known fact; the 570 uses a very similar mixer topology to the
7030, in that it uses a quad JFET ring mixer. A very good receiver design
is used in the Kenwood 570. Also, I like the fact that this unit uses glass
epoxy circuit boards.

742. Re: Why nagative feedback on Icom?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-16 11:34:10 UTC
From: NANCY GIANAKOPOULOS <n.gianakopoulos@worldnet.att.net>
Message-ID: <SkW86.3003$4y6.229911@bgtnsc07-news.ops.worldnet.att.net>
Source record: 66018

I have had very poor service from Icom, over the past several years. One incident that comes to mind is an IC211 all mode 2M transceiver. It had the usual problems, with the feedthroughs in the synthesizer needing resoldering. I did do that repair, but I had a real stumper that I never did figure out.
There was a problem that this unit had, whereby the T/R switching diodes would overheat and burn up. I order a service manual from Icom, but the schematic was so illegible, that I decided to let the Icom folks fix it. They did contact me with a very high estimate, noting that it just would be worth the expense. I told them to fix it anyway. I appears that I ended up calling their bluff, because then they admitted that they weren't able to figure the problem out.
This in itself isn't too bad, because the 211 is a monster to work on, and these people are only human. The next incident I would consider inexcusable, because it takes arrogance to new heights.
A friend of mine purchased an Icom R1 receiver from a dealer down in Texas. I don't know if that receiver had a poor synthesizer design, or if it was just a bad sample. The problem was that with medium strength signals, the unit would have desense problems as far as 200KHz away. My friend brought the unit over to my place, and we took a look at it. Even with a signal as small as 50uV, you could hear a signal 200KHz on either side. When the unit was sent back to Icom, it was stated that there was nothing wrong with the unit, and that for the price that the R1 sold for, one could not expect perfection.
Anyway, Icom did not stand behind this poor offering of a product, and if it was not for the niceness of that dealer down in Texas for eating the cost of that unit, my friend would have been out of luck. They ended up giving him full trade-in credit for another type of radio.
I just thought that I would throw in my 2 cents worth!

Before you defame this guy publicly:

1. Did the deal include those items or did you ask for them later
2. Are these items considered accessories or standard pieces of the
unit

Any deal one makes sight unseen always has risk. The worst case is where
you send the money and the equipment is always being shipped tomorrow!

Your math is quite correct. 31.6uv equates to approx. -77.5dBm. 20dB down from there would be -97.5 dBm or about 3uv. All's well with the world.

What will you bet there's a big fat 50 Ohm resistor inside there?
>
> The question is how does it work?

Very very poorly. You waste about 95% of your power into the resistor.

> How CAN it work?

Simple. It's a very leaky dummy-load. The radio sees 50 Ohms on 99% of
the freqs and some power leaks out the wire(s).
I made one long ago and the only time I ever used it was for working QRP
since my rig had no power output control.When using the leaky-dummy
people use to ask me if my antenna had blown down since I was an S2 or 3
on that stupid thing when usually I was well over 9.

Message-ID: <29775-3A647276-26@storefull-134.iap.bryant.webtv.net>
Source record: 66032

First, the history....
I grew weary of having my HT tied up on the charger for 15 hours at a time, while I walked around with the other fresh battery in my pocket. So--- I built a charging stand that holds the low battery and I just plug the wall wart into my stand.
Now I'm wondering--- will the charging rate and time be the same as when it was on the radio? I noticed the radio makes contact with the battery pack in 3 places, but the bottom contacts just have 2. Is there some kind of circutry in the FT-50 that reduces the charge voltage to the battery?
The wall wart puts out 15 VDC, 200 ma... into a 9.6 volt battery. Am I overcharging my battery? TNX DE Johnny

Source record: 66035

I've apparently fried my receive pre-amp or another component in the receiver circuit of this h.t. It receives but the sensitivity is VERY decreased..repeaters 50 miles distant used to be 1/2 scale and very readable are now <S1 and VERY noisy, indicating that the S-meter isn't damaged because local repeaters are unchanged..I had this h.t. on the same d.c. line in the car with a G.E. TPL 100 watt rig for 6M and didn't realize the h.t. was so sensitive to rf..afterwards the h.t. was very deaf!..I also had a htx-10 10 meter rig on the same line with the ant abt the same distance from the 6m and it is totally unbothered by the 6m rf..
ANYWAY back to the post!..Does anyone have a copy/original of a RS service manual for this little h.t.? I'll gladly pay copy expenses!. The owners manual has a schematic that is very small and I can't get the gist of the receive path..HELP!
Good Dx to All
Long Live 6 Meters!

Hi,

What bugs... if you say A, you should say B as well.

So far my dealer has no real known bugs, apart from some rumours that
the HF reception is not that good. They will get their first next
week, and put it on the test bench.

I'm looking forward to their 'real' test results... no 'I hear'
statements anymore.

Should be.

I noticed the radio makes contact with the
> battery pack in 3 places, but the bottom contacts just have 2. Is there
> some kind of circutry in the FT-50 that reduces the charge voltage to
> the battery?

I would think so. They need to protect for high rate chargers.

> The wall wart puts out 15 VDC, 200 ma... into a 9.6 volt battery. Am
> I overcharging my battery?

No, the voltage will drop way down once you hook the battery up. The
wall warts have little regulation at all.
200 ma is a pretty good charge rate. Depends on the size of the battery.
Would be 1C or a 15 hour charge for a 2000 ma battery, or a 7.5 hour
charge for a 1000 ma battery. A 600 ma btty would charge in about 4
hours. The best way to know is measure the voltage while charging. With
ni-cads the voltage will peak out and then the battery just starts
getting warm. Usually a 1.2v cell will peak at about 1.4 v or so with a
full "float charge" and charger still connected. So if you had 8 cells
adding to 9.6 volts, the full float charge should be about 11.2 volts.
When it reaches this point and levels off, you have a full charge and
need to unhook the charger. nickel hydrydes show a slight voltage drop
when you reach full charge. So those are easy. Just wait until it peaks
and then drops .01 volts and unhook. This is how the NH auto chargers
sense full charge.It will continue to drop farther than that if a high
charge rate is used. Also you could lower the rate of charge by adding a
small lightbulb socket to the stand and putting a bulb in series to
control the current flow. You can adjust the rate by changing bulbs.
This is what I usually use here. I use a truck clearance light as the
charger housing and attached a small circuit board to it with a
rectifier. I use a 1 amp 9v AC wall wart as the power. I'm charging 7.2
v batteries. I could use a dc wart and dump the diodes, but that was
what was handy at the time.. MK

I think it's a nice looking radio. Was very tempting. But I heard the HF receiver performance somewhat lackluster compared to say a IC-746. Mainly problems in crowded band conditions. I think it's mainly a sat rig with HF as an afterthought sorta. But sure is a nice looking little rig, and I like the lack of all menu control. I beat my head against the wall trying to decide between the ic706, ic746, ft847, etc. I kinda wanted 440 for the purpose of the public service reception more than anything, but it does also add the sat angle. So although the 746 seems to be real good hf, it lacked 440. So the 847 was real tempting, but then I heard the HF a bit weak. Also I know someone who bought one and he didn't care for the hf on it either. So I ended up just going with the 706mk2g instead. If I going to have a compromise HF receiver, it might as well be in a smaller box..g I will use it mobile anyway much of the time. If you wanted to work mainly sat's and still wanted HF, but were not overly picky, I think the 847 would be pretty nice. Also I hear the 847 is much better if you add the extra filters. Anyway, being as the 706g will go about anywhere the 847 will in freq coverage and was about 400+ bucks cheaper, I ended up going that route. I was scared off the 706 for a while while I mulled the infamous "overshoot spike" that the 706's have, but I found that evidently the 706 g's have fixed the problem at least at full power. Or sorta fixed it anyway..The overshoot is equal to the 100w output, where in the first two models it would spike to 140-150w. You still have overshoot with the "g" at lower power levels, but I came to the conclusion I would be barefoot most of the time mobile, and if I run an amp in the house, I'll just make sure the amp can handle 100w no problem. If I had to reduce power , I could run the rig at full power and swamp the power down I guess. If they hadn't lowered the full output spike, I probably wouldn't have bought one. Also the 706 clips dits at speeds over 25-30 wpm when using full breakin, but fortunately, I don't like full breakin, so I'm ok there. As long as it's ok in semi-bk that is...I'm still waiting for the rig to test. Should be here about any time. I think they oughta make a IC-746G with 440 added. Tney would sell like hotcakes. I'd probably get one for the house. MK

I do not know if I am breaking any rules - but I just found a great deal on a power supply - ordrered one for myself. I have no connection to this company and am only trying to tell fellow ham's about a great deal.

I just bought a 25 amp home pwr supply model mfj-4322 from AES for only $69.99

I like this company [aes] have had great service from them. I consider this price to be fantastic and wanted to pass it along.

774. ARRL testing of OMNI VI

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-16 23:38:34 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <_X496.3475$tq1.201313@newsread1.prod.itd.earthlink.net>
Source record: 65948

While evaluating various pre-owned transceivers earlier in the year, I looked closely at the ARRL reviews and transceiver comparisons document available at their website. I was a bit puzzled when reading the Omni VI review (Nov 1997), which showed the Omni to be noise limited in the BDR test. According to a tech person at ARRL, the unit is noted as noise limited if the background noise rises by 1 dB during the test.

I found that a bit curious with the Omni VI, since it is supposed to have very low phase noise (according to TenTec). I posed the question to TenTec at their website where they invited folks to make technical inquiries. Their first response basically ignored my question, explaining how the Omni was super-quiet and the absolute best receiver on a crowded band. When I pressed for an explanation of how that matches up with the ARRL test results, the fellow explained that he really didn't have time for such a discussion.

Can anyone explain why such a "clean" receiver would be limited by phase noise in the test?

I bought the 847 last year when I was looking for an all mode vhf/uhf rig. I did replace the filter in it which did help it out on HF. I have a FT-990 so the 847 is just a backup hf rig. I think one will be hard pressed to find a HF through 440 rig that matches a HF only rig.

Hi Chris,

I had a DX70TH for a few months before dealing it for a Kenwood TS450SAT. Ran it mobile and worked just about everything I heard using only hamstick style whips. The receive is great, and audio reports were also very good. Many features for the price. I only traded mine because I am setting up a rig in the house again and the Alinco is a little small for that. The only thing I didn't like about the DX70 was the noise blanker. Although it worked quite well on ignition noise I found it added too much distortion on receive. But I wouldn't hesitate to buy another one. Even worked some good 6m FM on it.

The VEC fee is a session fee which means you can take as many exams as you like at a single examination session for one $10 fee. If a VE is charging the $10 fee per element at the same exam session, he needs to re-read his VE manual.

If that is permissable evidently they have changed the rules. When I
ran a VE team ('85 thru '93) the rules said one fee for all tests taken
at that session. Later it was deemed permissable to charge an additional
fee for a retest of a failed element at the same session, but we never
did.

Unless the ARRL has changed, it's not quite a session fee. It is insofar
as you can take one of every element for one fee. Retakes of failed
elements are subject to another fee.

I have for sale a Standard C178A 2m/70cm HT that is in great shape!
On a scale of 1 to 10 (10 being excellent) it is an 8.5-9!! Works GREAT! I
have the HT, Manual, Wall charger and Standard protective leather case. It
has the extra memory module with it for 200 channels installed! And I will
include the 40 channel module! CTCSS encode/decode, DTMF memories, DTMF
paging, 118-136 AM RX. The battery pack is the alkaline pack as the NiCD was
bad long ago, and I never bought another one! But I have the original
Standard wall charger.... just buy a battery! (Or use rechargable AA's as I
did!) I am asking $125 shipped in the Con. US... E-mail me at one of the
addresses below OR kf4uae@arrl.net for more info.... thanks...

1) Knight P2 SWR bridge with meter unit and remote sensing
unit/cable. Excellent condition. Picture available. Will sell for
$19.00 plus shipping.

2) Micromatch Model 262 SWR meters, with remote sensing
unit and cable.

Classic style equipment. This will look GREAT with any antique
ham radio station! I have two of these. One with the remote
sensing unit in solid metal as pictured on web site.

The other one has the same meter, but the remote sensing
unit has the more normal 'basket metal' finish. Same color.

They look great with Collins and other tube era rigs.

Both units are in excellent condition.
Will sell for only $25.00 for each unit, plus shipping.

Picture at:

http://home.cfl.rr.com/happysurfer/radios.htm

Hi,

I do have the oppertunity to buy a FT-1000MP in vy good conditions for
cheap money.

I heard that there are differences in the 1000MPs which depend on the
serial number of the TRX but didn't find any info abt this.

Can anyone explain them ?

Tnx in advance ... Carsten

I've been running PSK31 on my TS-440S using AFSK in and out for my connections. Phone in and out will work equally well on the TS-940S which I also have. The problem is getting the Vox and Anti-Vox levels set properly. They seem to constantly change. There are two ways to get around this by using the mike PTT or the Send switch when transmitting, or biting the bullet and hooking up the Rigblaster unit which is now available for about $90. I believe their web site is Westernradio.com. Hoope this helps.

I use a DX-70T as my dedicated mobile station. I love it! It does
everything I need it to do. My DX-70 was baked in the 4th hottest
summer on record, frozen in the 3rd coldest December on record,
rattled and jarred by driving the vehicle on our lousy roads, and
it hasn't given me a bit of trouble. The display is big and easy
to read, and no commonly-used functions are hidden in menus. I get
consistently great reports on the transmitted audio. The DX-70
comes standard with narrow SSB and CW filters, too! I have only
one minor complaint, that the noise blanker introduces distortion
on incoming signals with a low S/N ratio. Of course, there hasn't
been a really good mobile noise blanker since the Atlas 210X back
in the 1970s. This is my second DX-70 (never should have sold the
first one!), and if something happened to it, I'd go buy another
one immediately, without hesitation. For the price, you can't
beat it.

Drop by my web site and click up my "mobile station" page to see
pictures of my installation.

Are all VE's subject to the same set of rules? These guys seemed pretty confident that they could charge $10 per exam ... which is why i did not even attempt the extra class written element.... figured i'd wait an extra month and study a little more so i wouldn't be wasting my money.

The ARRL VE book, said, 1 fee for each test session, and it covered as many elements as the test taker wanted to take, or the VE have. But it is a new fee to retake a failed element. So as long as you keep passing you can do as many elements as you can pass for 1 fee. Remember though that most VE sessions have only 2 or 3 versions of a test element available and if you flunk all that they have, your done for that session.

Also, I would recommend against unhooking the attenuator for AM BC.
You'll pick up so much noise it will be a noise magnet. The stock
sensitivity is plenty as is. Probably still a bit overkill from what you

really need. MK

It's been a few years, but when I made General, I took the Tech,
General, and 13 WPM code at the same time for one fee ($6.45).
At another session I took the Extra and the 20 WPM code tests
again for one fee ($6.45). At the time, I was under the impression
that this fee went directly to the ARRL, to cover the cost
of the testing materials that they supplied. That ment that the
club, which was running the VE session, was really charging
nothing for their time.

Was I correct in my reasoning? Aren't they, the club, also allowed
to charge a small fee to cover their expenses?

Wow. If it ever works, OSCAR-40's going to be cool. I have a few questions about it:

1.)Those are HIGH frequencies. 5 and 28 GIGAhertz. What kind of radio/antenna would I use to access that? Some kind of Dish?

2.)What could those high frequencies be put to use for?

3.)Will OSCAR-40 ever work?

What you saw was someone take advantage of "Buy it Now". When you list an item, you have an option of setting a "Buy it Now" price, a price that someone can buy the item for as long as they do it before the first bid comes in. Once the first bid comes in, they lose that option.

Sometimes you can get a good deal on these items, apparently the person who paid $1,400.00 either thought it wasn't worth taking the chance on the final bidding going higher than that or was in a hurry to bring a closure to the auction. A couple of weeks ago, I saw a Peugeot mountain bike that had just been listed with a "Buy it Now" price of $30.00. Now those of you who know bicycles can imagine how fast I jumped on that!

>nothing for their time.
>
>Was I correct in my reasoning? Aren't they, the club, also allowed
>to charge a small fee to cover their expenses?

The ARRL VEC allows the VEs to retain a portion of the fee (up to $4 of
the current $10 fee, which is per session, not per exam) to cover
expenses if they wish to do so (this wasn't originally the case). The

ARRL requires that records of such expenses be kept, although the FCC no longer requires reporting. The FCC also no longer specifies the maximum amount which can be charged (there never has been a minimum). ARRL/VEC is charging $10, but others may charge more or less; the marketplace will probably decide.

From the ARRL letter, December 15, 2000:
==>FCC OPENS DOOR TO INCREASED TEST FEES FOR 2001

The FCC has suspended its regulatory limit on the reimbursement fee for Amateur Radio examinations, and the ARRL VEC says a new $10 test fee will go into effect January 1. An FCC Public Notice released December 4 explained that the Commission did not plan to announce a maximum reimbursement fee for 2001 since the requirement to do so no longer appears in the Communications Act.

For now, the FCC says, it will suspend enforcement of the fee provision, ?97.527(b), which continues to appear in the FCC rules. Some, if not all, of the nation's other Volunteer Examiner Coordinators are expected to follow suit, although at least one VEC charges no test fee whatsoever.

ARRL VEC Manager Bart Jahnke, W9JJ, says the ARRL VEC's current fee of $6.65 was based on the provision in the Communications Act, adopted in 1984, that established a $4 cap on reimbursement of out-of-pocket costs with an annual adjustment based on the Consumer Price Index. The new, higher fee reflects the fact that the ARRL VEC is doing more of the work on behalf of the FCC than was originally envisioned when the provision was included in the Communications Act. That effort includes data entry for all new and upgrade license applications once done by FCC staffers.

ARRL VEC volunteer examiners will continue to charge applicants $6.65 through the end of 2000.

It is a good rig, however you must treat it like it hasNO noise blanker.
Noise blanker distorts so bad you cannot understand SSB stations at times.

Per ARRL , Alinco will treat cases on an individual basis.

I love mine, use it in My Expedition...works great.

Pete,
I can't speak from experience, but I would surmise that lots of people
that have 6M handhelds also have FM repeaters locally. When the band
is open they are able to work stations far away that access said re-
peaters. It wouldn't be impossible to work direct as well, but it might
be rare. Thus, a challenge some can't resist.

Hi pete -- here in San Diego the Palomar Amateur Radio Club operates a 6M repeater. A dozen or so use this for chit-chat. In addition its used for official Races/ares nets. Its a nice band to have a quiet QSO without others butting in. Not that happens all that often on 2M -- but 2M is crowded and its best to take long one-on-one QSO's away from a popular 2M repeater -- 6M works nicely.

But best find out about 6M repeaters and 6M users in your area.

As for skip -- usally takes a better antenna than an HT -- but a few here have worked back east with a 6M HT.

I have a *PRISTINE* FT920 for sale. It has the 500 hz CW filter installed and is in original condition. This has been my back-up rig and has very limited use. It is flawless!

I am the original owner, non-smoker and non-contester. Bought this rig solely as a back-up to my FT1000MP.

Has original boxes, instruction manual, and mike.

Selling for $1025...let's talk about shipping.

At one time that was completely correct. I ran a DeVry/Great Lakes core from 1984 (before League involvement, by the way) through 1993. At first the local core didn't get anything, but eventually DeVry/Great Lakes started a core reimbursement progam. By the time they folded and we changed over to ARRL, the League was reimbursing up to $4 to the local core.

> That ment that the club, which was running the VE session, was
> really charging nothing for their time.

Also correct. That's why we are called "volunteer examiners." My club, however, covered all my costs for materials since I prepared all of our written and code exam materials and purchased or prepared other materials such as blank paper, pencils, 610s, etc.

> Was I correct in my reasoning? Aren't they, the club, also allowed
> to charge a small fee to cover their expenses?

Not at the VE Core level. Only at the VEC (coordinator) level. And when a VEC does allow expenses to be covered by a core, it's always as a rebate from the VEC (I speak from DeVry/Great Lakes and ARRL experience only).

I'm sorry you had that experience. I can't answer whether a VEC can instruct their cores to charge for each element. I can say that ARRL does not, nor did DeVry/Great Lakes when I was with them.

Who was the VEC for your exam? I have my own suspicion, and if I'm correct it's further confirmation of why I will never have anything to do with him.

Irrespective of who it is, it's an example of poor training of the VE team. That's one of the things that should have been basic in their instruction. I suggest you write a letter of complaint to the VEC.

With all the new rigs that have 6m, I see it becoming more popular. I'd always been scared off from it in the past due to having a CH#2 tv station in town, and fearing tvi problems. Also in the past to work 6m, you had to buy a stand alone 6m rig, or build one. So the traffic pretty light it seems. As far as I know, there are only a couple of 6m repeaters here in the Houston area, but I keep hearing more people that want to try it. Mainly due to all the new rigs that include 6m now. I've never worked 6m yet here, but plan to try it soon as I bought a rig that has it. If the tvi doesn't rear it's ugly head, it might work out to be a good band. I hear the problems are not as bad as feared as long as no problems in the setup. ant/feedline, etc. I'm more interested in ssb/cw I think than fm. A few of use here in town that get on 2m simplex at night are going to try 6m pretty soon just to see what it does. I know 5 or 6 that are interested just off the top of my head. MK

Hello,

I have had my Yaesu FT-847 now since last September and I just love it. I work all over the place, up and down HF and am very pleased with its performance. I even run the rig mobile about 75% of the time with its mobile bracket. I run the rig stock, no added filters and do just fine. I plan on maybe adding some SSB filtration but am often swayed as it seems not worth the extra money... Don't fret its a great rig and very versatile, and the solar peek won't last forever so Satelite work may become very attractive in the near future. As for the IC-746 or IC-706...Go luck in Satelite "Full Duplex" operation!

73! Don't you just love this hobby!

I guess it's a matter of semantics. Retests of failed elements are, for
paperwork purposes, considered separate sessions (or sittings).

The ARRL/VE Manual says "The ARRL/VEC charges $6.65 per candidate, per
session." Of course, that was published before the fee increased to $10.

The original poster said they were going to charge for each exam (element),
which is inappropriate.

I have a *PRISTINE* FT920 for sale. It has the 500 hz CW filter installed and is in original condition. This has been my back-up rig and has very limited use. It is flawless!

I am the original owner, non-smoker and non-contester. Bought this rig solely as a back-up to my FT1000MP.

Has original boxes, instruction manual, and mike.

Selling for $1025...let's talk about shipping.

>what are people using the 6m band for (with handhelds)? What kind and how much activity do you find there?>>

LOT less than on 2M!! <<grin>> Just had a nice QSO with a ham in Colombia, SC from Spruce Pines, NC (150 miles or so) using the Mt. Mitchell repeater (OK, it IS at 6,000 ft). I'm using one the the cheap Cherokee HT's...strange programming, but decent audio and the 5 wts out will hit repeaters. DO get the high performance antenna, the "stubby" 6M antenna makes a nice dummy load.

Source record: 65830

My experience with Icom was quite the opposite. On November 8, 2000 I sent in my faithful IC 765 for alignment. Some of the frequencies had drifted a bit after 10 years and no previous service. I spoke once with someone in their service department. I got through after a 3 minute wait. The person was quite helpful. The radio was back with me on November 20. It is working perfectly. The repair cost was quite reasonable. I'm sure some of us have had poor experiences but I was quite pleased.

>
>

The usefulness of a 6M handheld, or any six meter rig for that matter, depends on others using the band. If there's nobody to talk to, then it wouldn't be very useful. That doesn't mean the band is useless.

One upon a time, the lowest band that a US technician class licensee could use was six meters (and originally, the license was only good for 220MHz and up). There were a lot of simple AM transceivers, ranging in price from low cost to expensive, and with time all the major ham manufacturers, which at the time were US-based, had six meter SSB transceivers. Since this was the lowest band that technicians could use, I gather they tended to use that band for a chance at long distance communication. Most of the time, it was local (but of course, there were other locals to talk to then), but when the band opened up, they could go pretty far with the low power and simple antennas.

FM and repeaters gained popularity, and the populr VHF band became 2meters. Probably because there was more commercial surplus gear for that band than low band. And then with time, the technician class gained the use of 10M. So 6 meters lost it's role as a popular band.

So if somebody wants to try 6Meters now, they may find it quite empty much of the time. If it is being used locally already, then there will be someone to talk to.

On the other hand, the band still opens at times, and one can still go great distances with low power and small antennas.

I would think a 6M handy talkie has the advantage that it is portable and if the band opens up, you can take it to some place where there is height, and make up for the lack of antenna. This hilltopping was something in the old days of AM and the Gonset Communicators and it would still be valid today.

The real trick is to keep transmitting on the band, so if it opens up, anyone listening will know. If everyone is waiting around for signs of activity, the band opening may be missed. Likewise, someone has to populate the band in the first place, in order to make it viable for others.

You said it. A dish

> 2.)What could those high frequencies be put to use for?
>

How about communication? Generally speaking higher frequencies allow
more data/ unit time.. i.e. television, high speed packet, etc...

> 3.)Will OSCAR-40 ever work?

It will not work as they had planned. The low gain antennas apparently
have troubles in themselves, their relays or feedlines.
Why or how this could happen still is a mystery.

It looks like the 2 meter transmitter is toast. Good.. we should have
been off two meters years ago from space.

The 70 cm transmitter may be toast or effectively not operational.
Too bad, but it could have been worse.

All receivers and high gain antennas work.. GREAT uplinks are GO

The 2.4 ghz transmitter works..

Looks like a possible mode would be 70 cm up and 2.4 ghz down.
With high gain antenna EIRP from ground should be smaller than with
other satellites.

But, that said the SUN sensor is dead. BAD BAD news.. the attitude of
the craft may wander and antennas point away from Earth.
This could be a disaster for communications.

So far the jury is out. But, the situation isn't as bleak as it could
have been. A total loss..

For some reason, while I was trying out my Heil audio system on my Radio Shack HTX-10, it did something to the audio in it and it will not send audio with the carrier. It will transmit a carrier without problem, just no audio. I bought a new one - so i'm selling the defective one *hoping* for $60, but will consider all reasonable offers.

Message-ID: <3A668D2D.BF955B88@cts.com>
Source record: 65843

Hi:
Thanks for reading this posting.
From work I received a broken Motorola Radius P110
radio. It seems to tx ok around 467 MHz, and
seems to rx only if the squelch is defeated. Does the P110
have a tone squelch ? I tried all the sub audible tones from
67 through 250 Hz, but the squelch did not open.
Does it use a tone sequence ? Or just an odd ball
tone ?
Next question is, does anyone have any shareware
software to program the radio ? I thought I could use it
as a radio for packet or just as a back up receiver.
It seems to have great audio.

Last time I checked Tom D, It is extremely easy to get caught by the
FCC. Since you're stupid enough to broadcast without a license, you'll
probably either not use a callsign or assume someone else's. And if your
local FCC people are as good as mine (friend got busted working without
license... told him not too), you're dead in 30 minutes once they figure
out it's an unlicensed transmission. And of course, you would use
DejaNews.

> out it's an unlicensed transmission. And of course, you would use

The FCC does NOT have a local representative in every town, city and
barnyard.
They do have very good, high tech directional locaters, but even they
from miles away cannot immediately nail a station. They need their Van
with gear inside.
We've had so much jamming to our net lately, including the playing of
music, you would think FCC would easily nail these stations, but its NOT
that easy. First you need the FCC's attention and then their continued
coordination to nail the jammer, unlicensed station etc..

873. KENWOOD TS-870S SERVICE BULLETINS ??????

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-18 13:38:58 UTC
From: rong@computer.net
Message-ID: <3a66efa5.567869@news.computer.net>
Source record: 65856

Have any of you other TS-870S owners noticed that Kenwood has not posted any technical bulletins for that radio on their website ??? There have been a few published, but you can only get them when you buy the service manual. They call them "technical bulletins" instead of "service bulletins". What happens after you buy the manual--do you have to buy it again for later bulletins ??? Does anyone know why they are not on the website ????

Put an external antenna on it and you might have a decent little QRP
rig. CBs have had 4 watts for years, and before I became a ham, I used
to get a huge thrill out of talking barefoot across the country.

> I have been reading some negative...

It's part human nature ... it's part Internet folklore ...

"Human nature" because folks LOVE to complain when they believe they have been wronged. And the anonymous nature of the Internet and these newsgroups is PERFECT for whiners and complainers.

When one person whites in a newsgroup like this, "I received poor service from XYZ, Inc. ..." - it does not necessarily reflect the true nature of the customer service department of XYZ, Inc.

VERY RARELY do the complainers provide complete details of their situations ... but, because they're anonymous behind their keyboards, they feel "better" whining in public.

Then, to compound the problem, some folks take everything they read in these groups as gospel, and re-state others' opinions and rants.

Icom has been - for me - very responsive and honest in their turnaround times and estimates for repairs over the years. Please make your contact with them, and be completely forthright with your problem(s). And then please report here YOUR own findings and experiences with Icom.

Even the Kenwood TS-2000? I like that VHF/UHF compatibility, but, I can
always buy a different radio. So you're saying it will beat ANY other
radio, even ones that cover not only HF and 6m but 2cm and 70cm? Well,
it's not like AO-40 is going to be in operation any time soon. And how
many of it's far-out features do you use?

Do you use the RTTY demodulator?
Do you use the Digital Voice Memories?

Does ICOM make an expansion allowing the 756pro to access VHF/UHF?
Probably not. But, ICOM does make a VHF/UHF radio so I shouldn't whine,
but the TS-2000 has HF, 6m, 2cm, and 70cm for $2,300. I welcome anyone
to convince me that it's worth the extra money. I don't mean to sound
stubburn, but it's a couple hundred.

I have a *PRISTINE* Yaesu FT920 for sale. It is a 160 through 6 meter rig.
It has the 500 hz CW filter installed and is in original condition. This has
been my back-up rig and has very limited use. It is flawless!
I am the original owner, non-smoker and non-contester. Bought this rig
solely as a back-up to my FT1000MP.

Has original boxes, instruction manual, and mike.

Selling for $1025...let's talk about shipping.
N2TU@optonline.net

You may have tried this, but switch the microphones of the two HTX-10's
and see if that solves your problem.

Source record: 65865

I am looking at some antennas for my vehicle and was wondering how much difference there is in the 1/4 and 5/8 wavelength antenna's. The 1/4 wave I'm looking at is 17 inches long and the 5/8 is 43 inches. The 1/4 wave has a spring included but the 5/8 I need to buy one for it, what effect will that have? How far out can 1/4 wave reach? This is for 2 meter.
Also, I have found that Firestik makes 2 meter antenna's, anyone familiar with the quality? I know their rep for CB antenna's so I would think their 2 meter ones would be good also.
Thanks,
Chris

Have for sale-Kenwood TM-742AD tri-band mobile, with the 6 meter module installed. This unit was used mobile (non-smoking environment) for a short time and rates a 9 out of 10 in appearance and a 10 of 10 for performance. Sale includes all original equipment, box and manual. Other options included are: TSU-7 CTCSS tone module, DFK-4 remote cables kit, and an MFJ duplexer. This rig has also been professionally modified for extended RX and TX. Digital photo(s) available upon request. Asking $675 + actual shipping and insurance from Michigan.

73,
Chris

You don't get "nothin for nothin"...
Lets see how the ARRL spec out it's test of the TS-2000.
Remember the FT-847? do it all radio? Crummy receiver...

I know for a fact that the 756pro has a decent (not perfect,
by all means) receiver. Time will tell whether Kenwood has
a hit or a miss with it's product.

Beware the hype.

Travis,
Your original post asked about the performance of the IC-756PRO, not how it stacks up coverage-wise with a rig like the TS-2000. These are different questions. These are very different radios, meant for very different uses. The TS-2000 is an all in one rig, meant to do many things and cover many bands with performance secondary to coverage. The IC-756PRO is a competition class HF rig, meant for things like contesting and DXing.

In amateur radio, more bands does not usually mean better performance. Sure the TS-2000 does cover more spectrum, but doesn't have the HF receiver of rigs like the FT-1000 series, IC-775 and the IC756PRO. To get all of that coverage in a box with a reasonable price, Kenwood had to make some compromises and one of those will be RX dynamic range and selectivity. The same is true of the FT-847, which is similar to the TS-2000, but without the 1.2ghz option.

If you want a rig that covers VHF/UHF, as well as HF, then by all means, go buy a TS-2000 (or an FT-847, if you don't need 1.2ghz). But know that if you use it on HF, you're going to get more interference and it will be more fatiguing to use during contests and pile-ups. And in many cases, you just won't be able to hear some stations. If you don't know why a rig like the IC-756 or one of the other competition class HF rigs is worth more than something like a TS-2000 or FT-847, then you don't need one.

That said, the IC-756PRO seems like a great HF rig overall. Good specs for sure, although I haven't gotten to use one under contest conditions.

I worked a lot of countries on 2W SSB with a Ten-Tec Argonaut and a 2W Mizhuo 10m "DX Handy". It can be done.

> I realize it may be "intended" for freebanders....

It looks like everything that dealer sells is intended for freebanders and pirates. The HT says it "can be modified". A rig advertised as a 10M rig shows a 27 MHz frequency on the panel. They list "Export" rigs. Not to be used in this country, eh?

I was tempted by the 10M HT but I'd rather not deal with that sort of vendor.

The FCC ought to take a look.

Just to let everyone know, I made my decison to go with the 'pro. I looked at the ICOM and the Kendwood side-to-side and I also remembered that I don't do too much (if any) VHF/UHF and the Kenwood's receiver is not up to par with the ICOMs.

900. FA: LAST DAY- Heathkit SA-2060 2KW Tuner Roller Ind!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-18 22:21:49 UTC
From: radiotek@pacbell.net
Message-ID: <3a676aa8.94104909@news.nvbell.net>
Source record: 65876

I have a Heathkit Model SA-2060 Full Legal Antenna Tuner for auction. This has a Roller Inductor, which is the best type. It tunes balanced & unbalanced feedlines, Coax and Single Wire Antennas. It has a 4:1 Balun, Power/SWR Meter and 3 Position Coax Switch.

This works 160 Meters to 6 Meters STRAIGHT THROUGH! The built in Power/SWR Meter can show Forward & Reflected Power Simulaneously! This is a great tool that can show you your power while transmitting. That way if there is a problem with the antenna, you can view the change in power. You can also push a couple of buttons to show only forward or reflected power.

This is the best antenna tuner that I have ever run across. I was able to tune down to the 80m & 160m region on a 10m dipole! I can't use this anymore due to location, so I am selling it.

The auction is ENDING around 8:00 PM Pacific Time Tonight, Jan. 18! The price is nice..... Please visit:

The thing that came to mind when I first turned on the PRO (using the SP-20 speaker) was AM. The superior audio quality of many of the SSB signals reminds me of the quality signals during the days of AM.

It was an ARRL VEC in Woodstock, IL ... put on by the
McHenry County Wireless Assocation. I could dig up the
names from the CSCE, but i don't think we want to put
anyone on trial here. :)

> Irrespective of who it is, it's an example of poor training of the VE

I really don't have anything to complain about... i didn't pay the
additional fee -- i just didn't take the extra class exam after I
passed the general class one.

Look at the product reviews at http://www.eham.net (user anecdotes,
mostly) and if you're an ARRL member, look at the review in the
archive at http://www.arrl.org

I was all set to buy one, too, until I read the review.

Mark,

I think you'll be pleasantly surprised. I have 2 IC706s, and we are for-
tunate to have 6M repeaters around. I haven't heard a soul speak of tvi
trouble yet. As to the FM repeaters, they sound pretty much like 2M
and make a right nice reliever band for 2M. Two meters is very crowded
everywhere. I'm not much on 2M--never was. We used to have 4 6M re-
peaters within easy reach. One guy moved away and took the machine. One
went down for whatever reason and never came back so we have 2 left.
Some of us locals get on 6M SSB and ragchew or even 6M simplex FM. It
is lotsa fun.

909. Kenwood furnished TS-870 Control software

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-19 00:04:48 UTC
From: "Dennis P. Stahr" <irfutures@earthlink.net>
Message-ID: <AwL96.1166$k26.73831@newsread2.prod.itd.earthlink.net>
Source record: 65885

Is anyone successfully using the Kenwood furnished TS-870 Control software?

I just received it from them, and can't get it to connect. I have configured the port and the software to be the same, and it says it cannot connect. The display says "Ctrl" so the rig "sees" the software, but the software doesn't work.

I have tried third party control software on this rig and it works fine, but this doesn't. Any suggestions? Please.

Source record: 65886

The P110 does have programmable squelch. If you can measure the TX frequency, the receive should be 5 Mhz. lower. You need to be on the exact frequency to be able to play with the tone or digital squelch.

It takes a special programing adapter to program the radio. The power is supplied to the radio for RX only with the programing adapter. Also need the RIB to go between the radio and the computer. Then you need the software to be able to program the radio.

Have fun.

Jim

Toshiba Color Laptop, 486/dx33, 200MB HD with floppy, PCMCIA 56K, WIN 95
loaded, 56K PCMCIA modem, external clip on mouse, battery nominal, case,
charger, some manuals. The only thing
wrong with unit is battery will not lock in place. Photos upon request.
$150 plus shipping
~~~~~~

I have a NIB Fuji MX-2900 Digital camera with all accessories including 8MB
flash card. I just don't need this much of a camera. I will sell for
$600shipped FedEX...Photo upon request, let me know if interested.
I have great ebay feedback..
~~~~~~

Sharp VN-EZ1U Internet MPEG4 Digital Viewcam with 1.8" color lcd, 4x zoom...
The smallest ViewCam ever, the VN-EZ1U fits in the palm of a hand, measures
a mere 3.2" x 3.5" x 1.7" and weighs only 5.2 ounces. The new camcorder
employs a built-in 1.8" TFT LCD screen in place of a viewfinder. With one
hand, the user can take shots from various angles and positions - overhead,
underhand, even record him/herself - while viewing the LCD monitor and
rotating the 270 degree lens. The lens also pivots into a protective
housing, to prevent damage when not in use. In addition, a built-in 4x
digital zoom ensures minimal image distortion.

Continuous Recording
Internet ViewCam users get up to one hour of continuous recording time on
four alkaline AA batteries or up to two hours on four rechargeable nickel
hydrogen batteries.

Asking $575 plus shipping or consider trades.

912. Tracking down RFI

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-19 01:50:27 UTC
From: Steve Woodruff <sjwoodr.nospam@nospam.email.com>
Message-ID: <9486h7$il0$1@flood.xnet.com>
Source record: 65888

It seems that i'm suddenly causing a bit of RFI in the cable tv in my own house. No equipment has changed, but the RFI suddenly appeared. I've checked my ground wire connections at transmitter, tuner and the grounding point (water pipes) as well as the feed-point connection to my dipole. Everything seems nice and tight. I also notice a higher SWR.... my normal tuner settings didn't work for 40m. I was able to get it down to 1:1 on the tx side, but it seems odd that it would change drastically. Anyone have some tips to help me track this down? tnx

There may be times when using a radio out of its "type accepted" band is probably not all that offensive in spirit or practice even if technically against the letter of the law. (e.g. marine use where no harmful interference is involved). But using the FT-50 for FRS is not one of those times.

The deviation of the FT-50 is wider than that of the FRS radios. So when using the FT-50 on that band, you are not only transmitting at higher power than the FRS, but run the risk of splattering onto adjacent channels creating harmful interference.

Bill

Hmmm. I know a lot of those guys. I ran exams just down the river from them in Aurora. In fact, the guy that started the testing group up there years ago and I were both with DeVry VEC originally. I can't remember callsigns, since I've moved, but there must have been some turnover that leaves some uninformed VEs, because the guy I know wouldn't do that or train his people to do that. Sorry.

> I really don't have anything to complain about...

Yes you do. You were prepared for an exam and an incorrect interpretation by a team that should know better kept you from taking the exam when you were ready. Although you might not get any satisfaction, they need to be made aware of the problem so it doesn't happen again to someone else.

6 meters is a strange but fun band. You'll hear a lot of nothing
most of the time. You should hear local activity on simplex and the
repeaters however. I chat with locals all the time on 6. When the band
does open it's a BLAST! You never know what to expect next from 6 but
when it happens, YAHOO!

You're missing a point here -- hf radios that throw in a lot of
vhf/uhf bands are typically highly-compromised designs that do not
work as well as radios that operate strictly hf or hf/6...

Jim:
Thank you for the reply. My P110 seems to be set for simplex, and
it has some sort of coded squelch, but it does not use the standard
sub-audible tones.

I managed to find a schematic for a RIB and the
information necessary to make the cables, however, I have not been able
to
find any software to reprogram the radio. Do have a copy of the software
?

Peter

Yes,they are supposed to be.

These guys seemed pretty
> confident that they could charge $10 per exam

By the authorizing law they are not supposed to charge beyond recouping
their expenses, unless it has changed since I was active. I understand
that the FCC has stropped setting the mandatory fee, so the VEC under
which they operate should be doing it.

FCC never did stipulate nor specify what constituted an expense, they
just said that the expense must be related to the testing and that a
record of all monies received and disbursed be maintained.
The fee receipts were always split by the VEC (ARRL here) and the VE
team. The VEC sets the details of he split.

Source record: 65904

Steve:

It's always a good idea to have a low-pass filter on the transmitter output, but make sure it's on the transmitter side of the tuner.

That still may not cure your problem. Often, grounds change effectiveness if you haven't had rain in a while. If you have been having rain, check to see that your coax, center insulator and end insulators have not been invaded by moisture. I have seen rain water "wick" its way down to the shack and corrode the inside of the connector where you can't see it.

If you still have TVI, try a high-pass filter on the TV, as well as wrapping the cable to the set a couple of turns around a torroid. Wrapping the power cable around a torroid as well should complete the job. You may need to do the same treatment to the VCR, cable box or anything else that can conduct RF into the TV.

www.ac6v.com has an excellent list of links you check out for more details.

Source record: 65906

Thanks for the tips. I'll look around for a low-cost low-pass filter.
In the mean time, i went out and evaluated my antenna connection.
I had RG-58 to a SO-239 connector, feeding a parallel dipole
(80/40/20m). The connections to the SO-239 connector looked
solid, but just for fun i ripped it off, and took an old RG-58 stub
and hard-wired to the dipole, then used a barrel connector to
the feedline. Now i have zero TVI when i'm running at < 100 watts.
When running at >= 100 watts, there only seems to be a very slight
problem on one channel (5). A quick scan of the other channels
showed no problems. Hopefully a low-pass filter will solve the
channel 5 problem. So i guess its possible the SO239 connector
wasn't making solid contact... i try not to do cold solder, but who
knows....

From: Rick Riverman <rbriver@home.com>
Message-ID: <iPQ96.283334$U46.9025305@news1.sttls1.wa.home.com>
Source record: 65908

FS: Kenwood TS-940SAT HF Transceiver:

- Serial number: 9090002 (late model with all the mods)
- Built in automatic antenna tuner
- YK-88C-1 CW filter ($88.00 from InRad)
- YG-455C-1 CW filter ($155.00 from InRad)
- Full service manual
- Operation manual

* Continuous receive from 100KHz-30MHz
* 160 through 10 meters transmit LSB, USB, CW, AM, FSK
* Dual VFO with A/B split band operation
* 10 meter FM with offset capability for repeaters
* 100 watt output all bands
* Auto tune any band in less than 20 seconds
* 40 memory channels
* Digital clock and auto timer
* I/O for PSK31 (uses the phone patch ports)
* Friction adjust for main tuning dial
* Built in power supply
* Many more features...

This is arguably the finest radio ever built by Kenwood.
I don't know of anything better for CW operation. Signals are
crystal clear using the above 400 Hz filters. SSB bandwidth can
be easily shaped and notched to bring you only the signal you
are looking for. 10 meter FM works as easily as your mobile rig.

All for $850.00 + shipping from 97006 (approx 50 lbs.).

Thanks,
Rick

Hi Dr. Conrad Connie,

Thanks for the reply. Of course the items were part of the deal and he promised many times to ship the missing items. He did not ship the missing itmes after many months, many promises from him (the seller) and many email. All those became many lies..

Yes. You may be right. But I have a lot of respect for EXTRA class hams.
May be you don't. I thought if he took the time to be an EXTRA, I would
expect a little more.

I definitely agree with you "Buttheads come in all flavors..."

Well when I decided to "auction" my radio I went to the eBay website and I clicked the button at the top of the page that says, "Sell." So when I place an item for auction on eBay I am selling it. Because I am selling it as an auction I put the prefix "FA" in the subject line of my post. This means, "For Auction." That and the fact that the link is to the auction website eBay makes it very clear that I am selling the radio at auction.

A search of this newsgroup shows over 1400 "FA" posts (the max for a deja.com search). That, and the fact that this newsgroup is related to amateur radio equipment, I think this is a proper forum to announce my radio for auction.

I hope I have cleared that up.

Auction link:

The VE's were incorrect to ask for another fee to take the extra. That should have been covered under the one fee.

Also, the VE group can keep a part of the fee, but only enough to cover their expenses. Their time cannot be charged. The rules did just change on keeping records of expenses incurred.

Here, go read 46 reviews for yourself.
http://www.eham.net/reviews/detail/418

I have owned a 756Pro for 6 months now and really like the radio. The highlights are the variable width filters, bandscope and excellent transmit and receive audio quality.

According to the ARRL VE Manual , Eith Ed. , 2000, p. 50,
under "Retesting,"
"An applicant who fails an element at an ARRL/VEC-coordinated session
may retake that element at the same session, if (1) the administering
VE team has a different version of that element, which the applicant
hasn't taken (section 97.509), (2) the VE team has the time and
resources and is willing to readminister the additional version; and
(3) the applicant pays an ADDITIONAL (emphasis mine) TEST FEE (because
the candidate is then considered a walk-in candidate who just arrived,
even if he or she arrived at the beginning of the session). Again, a
retest fee charge is only required if an element is retaken, after
being failed at your session."

The W5YI VE manual has the same thing .

The reimbursement fee (test fee) is the only fee that may be charged at
a test session. Now, if the test session occurs at a hamfest,
instruction class, or other gathering, an admission fee may be charged
and it has to be kept seperate from the test fee. If you're just going
to the test sesion at a hamfest, you shouldn't be charged a fee.

I have a nice CP-1 in perfect shape. Works
fine.......Paperwork.....keyboard overlays for Commodore 64. Have prom
for C-64 also, and C-64 also. Both in like new cond. With this you can
do morse, rtty, pactor, amtor. CP-1 with C-64 $100. Just add monitor.

Have Amber Magnavox monitor and Commodore printer with tractor feed to
go with above, and spare C-64 with power supply. Whole package with
about 50 disks with programs...$200 you ship. Guaranteed. to work.

Add MFJ 1270b TNC for $50.........$75 if bought alone. With Docs.

Mark ae8844@wayne.edu

Your P110 probably has Digital Private Line(DPL). I understand there is a
(read one) ham HT out there that will do DPL. DPL codes are three digit
numbers like 023, 152, 506.

Nems-Clarke Model 1500A Series VHF receiver. Tunes from 55 to 260 mHz. Receives AM or FM transmissions. Front panel has planetary gear tuning knob with indicator, AF gain, IF gain, AM/FM mode switch, power switch, AGC/MGC switch, AFC switch, loudspeaker, tuning indicator, signal strength meter, and phones jack. The rear panel has 110/220 volt switch, AC power connector, ext speaker connection, antenna jack, fuse, and IF output jack. This is a commercial quality radio in excellent cosmetic and functional condition. As you can see from the pictures, it is very clean inside. I have used it to monitor aircraft, control towers, television broadcast audio, commercial FM band, 2 meter ham band, as well as signals on my TV cable. It works very well. I am including a copy of the owners manual, which includes operation, theory of operation, maintenance and calibration, fold-out schematics, and circuit pictorials.

I would ask you and Mosley to reconsider the full refund(You accept it graciously) and then you post the results if Mosley does the FUll refund. This will look good to the Amatuer Community that Mosley went the extra mile to satisfy you even though you are a tough customer to deal with. I can't blame you for you anger (not all parts shipped with the antenna and the wait???) I am skeptical if Mosley really got the antenna to work when you sent it back. By saying the antenna works perfectly they sort of discredit the consumer and make him look like a idiot for ranting and raving. Since I am not at the Mosley factory I cannot say for sure. I think you are out the Attorney fees and so is Mosley. I have been in the Customer service end for many years and I have found out that it is in my company's interest to try to satisfy the customer before Attorneys get involved.
I will say that I was about to make a rather sizable purchase from Mosley $ 4000 total and I have decided to go with another manufacturer "just in case" this Ham Operator is telling the truth.

I just decided to stop a $ 4000 order to Mosley. I wonder how many others on this Newgroup have done the same $$$$$$$
By not satisfying this guy they have saves $ 5000 on the antenna but have lost $$$$$$$$ in future sales. Not very good thinking for the overall picture. I know I hve taken several "hits" on several customers in the past who were just about impossible to satisfy (basically unhappy people and it had nothing to doe with the product or service.) I took a hit to get rid of them and was lucky enought not to hear of them again till my competitor was complaining about the same customer. HA HA

Alright! You looked in the right place. The types of problems you were having are almost always antenna/feedline related. Almost NEVER grounding, and most rigs don't need a low pass filter. Otherwise, they wouldn't be able to sell them. They are usually fairly clean as far as spurious output. If the ant/feed wasn't the problem, then it's usually fundimental overload. This can only be cured by moving the antenna farther away from the house. I use a 150 watt iron to do coax connections. You must have enough heat. Most important thing of all when soldering. With the big iron I can get the connections hot real fast, do the soldering, and done. Fast. That way you don't melt everything. Only if a problem is proved to be caused from a spurious signal, would I bother with a filter. A quick test putting a good tuner in line can tell you if thats the case. A tuner makes a good filter. I've talked to a guy in NY that uses a old AEA 10m HT. SSB though, not FM/AM. Worked pretty well. Didn't blow the doors in, but we could usually talk. MK

I'll make me a 1/2 wl vertical or something to try the rpters. Maybe
make a yagi for ssb. I got the 706 yesterday, and have been running it
though the test mill. Overall, pretty well satisfied I guess. I notice a
bit of trash on 6m due to our BC towers 8 miles away, but if don't use
the preamp, it helps a good bit. I'm glad the 706 has both preamp, and
attenuator. It needs both to keep things under control as far as the
gain.
Maybe you'll hear me on 6m some day before this cycle poops out. Not
sure how long 6m will be good to F layer skip. This cycle was kinda
lame. But there should be a few more openings left before it goes kaput.
So far, I haven't heard a peep from hams on there, but I there should be
at least one repeater in town. I need to find the freq of it. MK

Don't know what you see in the review (haven't look there in
some time now), but the Yaesu FT-990 has the
best receiver (on par with 1000D) in its class, for a $1000 radio.
I will put up a decent 990 against the much touted FT1000MP, and I know
the 990 just works. I've used both (on field day, CW only) and the 990
wins hands down. It is a bargain.

In theory, the 5/8 wave puts almost 2x the power on the horizon
by flattening the beam but this can be a liability on a
motorcycle when heeled over to corner. I like Hustler's under
$15 5/8 wave for general 2m work but YMMV.

Beware of cheap VCR's & DVD's, etc. in the cable prior to the TV. Many employ non protected switching diodes that generate all kinds of crap when exposed to enough RF. Try hooking up TV minus the VCR and see what the result is.

I have a *PRISTINE* FT920 for sale. Rig covers 160 through 6 meters, has an internal antenna tuner, digital recorder, DSP, dual VFOs, DSP noise reduction.It also has the optional 500 hz CW filter installed and is in original condition. This has been my back-up rig and has very limited use. It is flawless!

I am the original owner, non-smoker and non-contester. Bought this rig solely as a back-up to my FT1000MP.

Has original boxes, instruction manual, and mike.

Selling for $1025...let's talk about shipping.

Cut the green wire, and reset. If that doesn't work,
sell radio and buy one that will receive above
440 out of the box with no modification.

To that you can add the Kenwood 950SDX -- and possibly the Ten Tec
Omni VI Plus (for a less gadgetized high performance rig)...

The problem is most of these radios are so complicated with so many
menu and filtering options, plus, the all have their weaknesses and
strengths, it's just impossible to say one is "best" -- especially
when you start factoring in price differentials, as well as whatever
your operating preferences might be.

In addition to the qst/arrl reviews I recommended, you might try the
transceiver reviews at http://www.eham.net/ (which has a review of the
new Kenwood rig, by the way.)

You haven't mentioned what your hamming experience is, but if you're
just starting out, you might do well to go for one of the less
expensive rigs and learn the ropes before buying the $3000-$4000
jobbies.

Good luck!

Bob

Yeah i have a 140/100 watt iron (haven't quite figured that out... except
that
the trigger seems to have a mid-point notch where the iron actually makes
an audible humm and the light is brighter than when the trigger is fully
depressed). I think i got the wire pretty hot.... when i was soldering the
shield/braid it actually melted the insulator around the center conductor.
I
had to snip that all off and start over (and work faster). You say that a
tuner makes a good filter? I'm using the MFJ 949E ... would you classify
that as a "good" tuner?

Boy! even Mosley couldn't have written it this good.
NO deal, if Mosley advertises a product and the costumer makes plans on how to pay and how to install it perhaps buying a special tower, then Mosley is obligated to DELIVER, or run the risk of been exposed.
Giving my money back after i planed for a long time to buy their product is not enough.
Obviously Mosley underestimates the power of the word of mouth and this story will cost them MUCH more than 4K$, that is mistake #2.

Can only compare FT990, and IC765.
Both excellent. Both about the same on
used market. Own IC765 (and 775), club rig is FT990
(I picked it out). They are both so close in
performance it'd be operator preference as to
looks/ergonomics and maybe brand loyalty.
I think the FT990 might be a slightly newer vintage
by a few (like 5, maybe???) years. Not sure if that
is any advantage.
One thing I can say: that darn FT990 has only keyer
inputs. No straight key. I operate CW exclusively,
and have to use outboard keyer of some kind if you
use CT to remotely key rig during contesting (once
you put it in "straight key" mode, keyer no longer
functions). Icom has both straight key on back, and
keyer input on front. VERY handy IMHO.
Can't help with IC756.
Good luck on your decision.

Vic,

The 990 has a straight key input, its the KEY jack on the front and back. :-) You need to use the correct plug, a 1/4 inch 3 contact plug. Key goes to the tip and ground of it. Or am I misunderstanding you?

Yes you do have something to complain about. It's going to cost you
another $10 to take the Extra exam at the next session when it should
have been included in the last session. Whether you took it when you
upgraded for general or later, they are still going to charge you an
extra $10. I'd show them the FCC regulation (I posted it here in
another reply to you) and ask for a freebie.

Maybe it is going to happen that they do away with the code all together, though I dont know why. 5 wpm is not hard at all to learn. If many many hams could learn 13 and 20 wpm in years past, 5 is really not that hard.
I think our biggest concern is that we keep all of the bands that we presently have in the form we have them. We do need to keep to keep our CW sub bands and that especially includes 40m.
We might not have CW in the test anymore some day, but from what I see posted on the DX summit, CW is certainly not dead or even fading away.

Question: What use is the additional bands if the radio does them
poorly? The FT-847 is living proof of this, it does a lot of
things but does most of them poorly, except for
perhaps it's 2M and 440 capabilities. I suspect that we're going
to see the same trend with the TS2000, because of it's schizoprehic
design and low cost- with the exception that they couldnt possibly
make the HF section quite as bad as what's in the FT-847. The TS2000
so far looks like Kenwood's attempt to show the community that they're
not dead yet.

That's the blanket solution? "Sue everyone". Why not just
simply refuse to use ebay? And tell others to do the same....
Of course, them being a monopoly.... one would want to
attack them with much zeal.

I have a *PRISTINE* FT920 for sale. Rig covers 160 through 6 meters, has an internal antenna tuner, digital recorder, DSP, dual VFOs, DSP noise reduction.It also has the optional 500 hz CW filter installed and is in original condition. This has been my back-up rig and has very limited use. It is flawless!

I am the original owner, non-smoker and non-contester. Bought this rig solely as a back-up to my FT1000MP.

Has original boxes, instruction manual, and mike.

Selling for $1025...let's talk about shipping.

n2tu@optonline.net

Thanks

Lou

Willy,

Have you tried using a small fan on the
heatsinks?

Radio Shack has a nice assortment of fans
in varying sizes in AC and DC models. I use
two of them, one on the HF rig, and another
on the dummy load. Works well, and radio
stays cool.

I have several dishes for sale.
The biggest is a KLM 12 foot with solid aluminum petals, and an az-el base with controller. I'm asking $200 for it.
I have an incomplete KLM 11 foot that uses screen petals. I have the ribs, etc. but not the screen petals or the mount. Make me an offer.
I have a KLM 8 foot using screen petals and a polar mount with controller. I'm asking $150 for it.
I also have a 6 foot solid aluminum spun dish. If you are interested, it could be used with the polar mount/controller that the 8 foot dish uses. I'll sell it for $125, polar mount/controller included.
Located near San Jose, CA. I can deliver in the SF bay area.

The element and in some cases the matching transformer in the mick.
most stock ham mick's seem to be 500-600 ohms, excepting condencer
types which are a higher impedance usualy around 3K

I have 270 lbs of duplicate magazines which I would like to find a new home for. These include QST (1964-93), CQ (1966-93) and 73 (1963-85). There are some complete years, most are not.

I'm looking for the following issues for my collection:

QST

1960 - All
1961 - All
1962 - Jan-May, July-Nov
1963 - All
1964 - All but April
1965 - Jan-July, Sept, Oct
1979 - May
1980 - April, Nov
1993 - Jan
1994 - All
1995 - All

CQ

1960 - Apr, May, July, Sept, Oct, Dec
1961 - Jan, March-Dec
1962 - Jan-June
1963 - March, Apr, May, July, Sept, Oct, Nov
1964 - All but Jan
1965 - Jan-Sept, Nov
1966 - Jan, April, June, July, Dec
1967 - Jan, Feb, March, June-Aug, Oct
1968 - May, June, Aug-Dec
1969 - Feb
1970 - March, April, June
1971 - Apr, Sept, Nov
1972 - Sept, Oct
1973 - Aug
1974 - Apr, June, Sept-Dec
1975 - Jan, Feb, March, May, Aug, Oct
1977 - Oct, Nov, Dec
1978 - Feb, March, Apr, May, Aug, Oct
1979 - March
1980 - Jan-May, July-Sept, Nov, Dec

Ham Radio Magazine

1968 - All but March
1969 - All
1970 - All
1973 - Nov
1974 - All
1975 - Nov, Dec
1976 - May
1977 - June
1978 - Jan, Feb, March
1980 - Dec
1982 - Jun-Nov

Thanks to all!

Glenn: you're misunderstanding. Yes, you can place straight key
input into radio. Once doing so, you MUST disable the internal
keyer. It works as strictly straight key. In doing so, a regular
key is unusable in either key jack. therefore, you need an external
keyer in order to create "straight key" keyer input.. the 765 will
do both. I can have straight key (therefore computer keying via
CT et al), and iambic key at the same time. VERY handy. Yaesu misses
the point on this...

Okay Vic. After reading your reply over a few times I thing the brain kicked in.

990 must turn keyer off to make irregular and sloppy fist butchery of CW

756 can break into nice keyer generated CW with sloppy fist without turning keyer off.

We might have too many toys...naw can't be that.

Thanks for your patience.

Glenn

==========
Hi Dan,

The part # should be k23-0794-04. This is from the 950SDX manual, but the
950S/SD should have the same knob for the attenuator. The agc knob on the 950SDX
is different--it is round.

Greetings!

Up for trade this time is a BEAUTIFUL Yaesu FT-767GX! This is a wonderful HF rig with space for 3 additional VHF band modules (no band modules included). This rig does it all! Only rig I've EVER seen that has a digital SWR and Power Output meter! Neat feature! Also, BUILT-IN AC Power Supply, built in tuner, and ALL the bells and whistles! Putting this up for TRADE ONLY! Interested in possibly a Kenwood TS-940SAT w/ options, or what do you have?!?! Make me an offer! Would also consider the Ten-Tec Pegasus with keypad and Desk Mic. Would prefer an 'in-person' trade. I am in Beloit, WI...well within driving distance of Chicago, Milwaukee, or the Twin Cities area, but again, will consider all trade offers! I do have the original box and manual with this rig...

73, es gud dx de N9LXX~~~

They all run pretty hot at high power. My ft-2500 ran hot as a
firecracker until I put a fan on the heatsink.
Don't know the size of thge sinks on your radio, but on the 2500 the fan
you see in a computer power supply was a perfect fit. With that size, I
can mount two of those side by side with a perfect fit. But only one is
needed. I put it over the final module. Runs real cool with the fan. MK

Sure, if it was a different type element. In general you have high and low impedances as far as mikes go. High usually meaning in the 10-50K ohm range, such as an old d104 crystal element, and low being in the 200-5k or so range. So as long as you stick with the same high or low imedance mikes you should be ok. You don't want to mix the two. A low impedance mike on a high impedance mike input won't drive the radio. A high Z mike on a low Z radio will likely be overdriving. Most all "modern" radios are low Z mike inputs. Which means in general almost anything will "work", but for the best audio it's best to match the Z of the radio as close as possible. Many of the new radios use eletret condensor elements which are dirt cheap, but work ok. They are low Z mikes, which means I can use any other type of low Z mike and have it work ok. I just rigged up a dynamic low Z audio technica mike to use as a desk mike for my 706 a little while ago, which uses a condensor for the default hand mike. Works fine, and sounds better than the hand mike. I did have to use my old preamp that I used to use for my 730 though. The output from the A/T is pretty low at 200 ohms. But I had to use much less preamp for the 706 than I used for the 730. Just a little bit did the trick. I could also probably step it up with a transformer and get enough to drive it, but I already had the preamp ready to go from the 730 setup. It's adjustable. MK

>
> --steve

Sure, as far as a low pass filter is concerned. It will attenuate
frequencies away from your operating frequencies. So can be used to
"test" for spurious garbage problems or even a permanent filter. If a
tuner helps cut a TVI problem , it's a good possibilty a harmonic etc is
the problem. But with most modern rigs ,this won't happen too often. In
most cases, I bet you see no difference tuner or not. Usually the
problem stems from the fundamental frequency these days. Either
ant/feedline decoupling problems or fundamental overload from just being
too close. MK

You can look for a computer networking cable and cut the end off and leave about 6 inches of wire on the end. Then wire it to a standard mic cable. I have done this to a Sure 526 T and it works fine. Even used the low voltage comming out of the Icom to power the mic so I don't have to fool with the mics 9 volt battery.

The leftover end of the networking cable can be wired to the sound card of a computer so that you can play with the digital modes. Very easy to just plug and unplug the cable if you ar using the jack on the front of the Icom.

But that's only IF you can hear the harmful interference over all the paging
tx'ers going bad..... :) I was under the assumption that the FT-50
deviation was the same as my Visars, which I use on FRS almost every day.
what gives?
thanks!
Randy

Source record: 65778

I have for sale a first class UHF repeater system. all equipment is
rack mountable. It would probably cost too much to ship the rack.
the system is as follows

Icom RP4020 repeater. no need for crystals. just use the dip switches
and set it to your frquency. runs on 110 volt or 12 volt

Cat 1000 controller with digital voice recorder and rach mount
enclosure can be programmed via phone line. with onboard modem

Motorola T1500 duplexers

pl encode decode it will do it all. this is a very nice system

I have over 4 thousand invested in this unit. let me know your best
offer. we can split the shipping cost

this unit is on the air right now and working great. the only thing
you will need is an antenna and coax.

pictures can be seen at
http://www.breazile.com/icom

I think if the Customer in question was the
US Government then Mosley would be much more accomodating. They are just bulling the guy around as they know they can make the legal system go slowly and wear down the guy legally. I guess he could go crazy like a guy did in Wakefield,MA near me and go to Mosley with a AK47 and shoot every person in sight, pick up the antenna and leave. He would still be without his $ 5000 though.
I am sure glad this didn't happen to me and I the company I just spent $ 4000 on antennas is equally happy.

> >
> > de Tim K0FL

Hummm, I did the same thing yesterday. I went to radio shack and looked
for the 8 pin modular connectors. I was looking at the standard versions
and noticed that they wanted 30 bucks for the 8 pin crimper. I kind of
gagged at that. Then I noticed they make a "quick" snap together model
for about 6 bux...So I went with that one. I found the wires coming from
my mike cord too fat to properly fit the mod plug, so I dug up an old
disk drive cable and cut a strip about two inches long with enough wires
to handle the 706, including the up/down if I decide to hook it up
later. The thin ribbon fit the plug just right, and I was set for
action. So I ended up with a two inch ribbon pigtail, which is not the
greatest looking thing, but works fine. I plug it into the back of the
rig for that mike, so no problems, it's outa of the way. If I could find
a male 8 pin, I could make my own adapter as they sell for 35 $.
Gag...But I'm not using my round 8 pin radio anymore, so I just dumped
it and went straight modular.
As a note, I found you "might" need a bit of preamp with the 706 if
using a low level low Z mike. I did here. But the preamp level needed is
very low compared to the old icoms. Many mikes in the 600-2000 ohm range
might could get by without it. As far as finding the icom version of
this adapter, it should be available anywhere that sells icom I would
think, but 35 $ too rich for my blood for a simple adapter. MK

Source record: 65787

re questions ao--40

1, antennas:
The 5, 10 and 28 ghz bands are microwaves.
A small 2ft dish is plenty at 5 ghz.
An 18in dish such as the tv satellites will be fine for the other bands. (with appropriate design feed antennas)
These bands will have significant doppler effects due to the moving satellite. antennas ar sharp like a searchlight beam, and require accurate pointing. Very freq stable and sensitive radios are necessary here.
Do not recommended these bands for new users unless all commercial eqpt is used.

2 what use:
These bands were included on the bird for skilled microwave people to "play with", as that what ham radio is about..

3 will ao-40 work:
Ao-40 is a very sophisticated bird, which unfortunatly has encountered some flight damage during its early life.
A very skilled world-wide team of people are operating./controlling this bird.
It is not in a great orbit just now, and it may take months to slowly maneuver it to a more useful orbit.
This bird can be a great thing for hams as it can cover 15m, 2m(145.9), 70cm (435), L-band(1269), S-band (2400m) and the above microwave freqs.

low tx power, about 10 watts, and a decent approx 10db gain yagi antenna will work on bands from 2m to to 435,
approx 16 db antenna gain is fine for 1269.
(yagi beam antennas will work fine)

Be patient, this orbit will take a while to straighten out, lets all hope well.

Contact ARRL or go to www.ARRL.org
for books to aid you..

1062. Kenwood TS-470S Squelch Problem

Newsgroup: rec.radio.amateur.equipment

From: va3ep@mail.com
Message-ID: <94fl1r$44n$1@nnrp1.deja.com>
Source record: 65788

My TS-570S seems to have developed a squelch problem.

When the squelch control is full up (NO squelch) when there is no signal the audio is full quiet (as if the squelch is not open). If you tune to a strong station it opens and performs normally. Also if you turn the squelch down and up quickly it will open for a few seconds, then close it again.

This happens on all bands / modes. I tried a hard reset and same results.

Anyone seen this, have any ideas or is it service time?

Thanks

Eric VA3EP

From: 2obvious@my-deja.com
Message-ID: <94fmrl$5nu$1@nnrp1.deja.com>
Source record: 65791

I'm an art student with no radio experience who needs to buy an FM transmitter for a project he's working on. I have this metal box with an FM radio inside it. It picks up all local stations fine, even inside the metal box. For my project, I'm trying to broadcast digital voice from my computer onto an FM frequency and into the box. I spent $30 on a transmitter from Radioshack, and it worked so poorly that I could barely pick up the signal even when the radio was outside of the metal box. I don't want to make this mistake again.

Keeping in mind that I can't build a radio and that I need an FM transmitter with a stereo jack on it (so I can hook it into my computer), does anyone know of a cheap solution to my problem?

Steve,

If you're not concerned about "collectability," Yaesu still sells
the fine tuning retrofit, for $3.70. All you need is a drill and a
soldering
iron to install.

Larry

>FT-900C/AT

Same

I have a FT-900/AT with conventional crystal filters. I've used it
mobile, and now use mostly in the shack. Nice radio. See the reviews
at www.eham.com or if you're an ARRL member, download the QST review.

The only thing Yaesu did "wrong" and have perpetuated in the FT100 is
the dang remote cable connection with two tiny metric screws. Someone
in their design department must have had couple loose when he came up
with that.

I'm pretty happy with the receiver. It ain't a Ten-Tec, but for most
applications is just fine. The notch and shift are effective, and the
500hz CW filter is fine, but wish they offered something between the
250 (too tight for general operating) and the 500. Maybe INRAD has a
400Hz ...

1080. f.s. 3 vhf portable radios regency Lmrt 2500, no battery holders or antennas 100.00US shipped

Hello All.

I have a problem with my Samsung Dot Matrix SP2412 Printer. While printing in one of the digital modes today the paper got tangled and I had to close the printer down. At this stage I was halfway through a long printout When I went back to the page where the trouble started my printer started printing from page 1 again.

Is there a way to start printing again from where I had the trouble?

Many Thanks
Jim (ZL2BMH)

1083. RE: FT-990

Source record: 65659

The following is an excerpt from the November 1991 QST review of the FT-990;

"In the dynamic range department, the FT-990 does reasonably well, but it's not quite in the same class as the FT-1000."

"the radio's IF and AF amplifiers emit moderately annoying high-frequency hiss, only the IF part of which can be filtered out by the SCF."

"Also, the 990's audio rolls off at high frequencies , which is particularly annoying when your listening to shortwave-broadcast signals with the wide AM filter in line."

-WB9YCJ (former FT-990 owner)

1084. FS: Ten-Tec Omni-D xcvr

Message-ID: <94gma9$p33$1@slb0.atl.mindspring.net>
Source record: 65660

For Sale: Ten-Tec Omni-D, version B transceiver.
Incudes the original model 252Mo 12VDC, 18 amp
supply, also the audio CW filter but has no xtal
filter options installed. Manual is included.

I've added the Ten-Tec WARC band kit for 30 mtrs
but xcvr doesn't have 17 or 12 mtrs.

The unit is in excellent working condition with an
almost perfect front panel. Cabinet top has been
painted black that nearly matches the original black
vinyl. Asking $375 plus shipping.

I've used the rig for a couple of years. It's great
on SSB and QSK CW. However, I've got two more
Ten-Tec rigs and this is a duplicate that I don't need.

73,
Doug/WA1TUT

Still Looking for the perfect trade! Thanx to all who have responded thus far!

Greetings!

Up for trade this time is a BEAUTIFUL Yaesu FT-767GX! This is a wonderful HF rig with space for 3 additional VHF band modules (no band modules included). This rig does it all! Only rig I've EVER seen that has a digital SWR and Power Output meter! Neat feature! Also, BUILT-IN AC Power Supply, built in tuner, and ALL the bells and whistles! Putting this up for TRADE ONLY! Interested in possibly a Kenwood TS-940SAT w/ options, or what do you have?!?! Make me an offer! Would also consider the Ten-Tec Pegasus with keypad and Desk Mic. Would prefer an 'in-person' trade. I am in Beloit, WI...well within driving distance of Chicago, Milwaukee, or the Twin Cities area, but again, will consider all trade offers! I do have the original box and manual with this rig...

73, es gud dx de N9LXX~~~

Go with the Heil HS-706 or their HMM-ic + adapter.

The Icom drives mics with 8v DC. To be safe, try using the mic without the preamp first. If your manual is like mine for teh 706/2G, there's a mistake in the mic wiring diagram. The diagram shows 3 wires coming out of the electret when there are only two.

I however, would go the Heil route. www.heilsound.com

Thanks for the reply,

I too have a new Icom 706G and will be receiving my free HS-706 soon. But for home use there is nothing like a desk mike that can pick up the room so you can roam the room without a cord, or just sit back a rag chew. I will be using the HS-706 in the car though. About the HS-706, how have the transmit audio reports been, and how is it for listening? Comfortable? I have a HC-4 Pro-5 Heil headset for my 746 how do they compare?

If you can get one of these Motorola desk mikes they are gorgeous and cheap, I have heard
these on Motorola Radius's and maxtracs, very clear clean audio. So I hope I can get the wiring diagram. All that is necessary is switching the wires to the proper terminals no soldering even(push-ons)!!! Its just four wires!

73's from W4BEN,
Benjamin Blavat

Steve,

Just call Yaesu's parts department, you can get the number off
their website www.yaesu.com. I called them because I needed a power
switch. They seem to break pretty easily. I asked the guy what other
FRG-7 stuff they had sitting around, figured I might as well amortize
the shipping charge, and he found the fine tuning adapter in the
computer listing. I couldn't believe it! I knew they'd existed at one
time, but I didn't think they'd still have any. I got it but haven't
installed it yet. I don't listen to SSB too much and I think that's
basically the only need one would really have for it. I've got enough
digital boxes around so I if I really need a fix of SSB broadcast
right wing lunacy, or whatever, I can use one of them.

I hope they've got some left, though I'd vote that you keep
at least one non-fine-tuning one in your museum in pristine shape.

Larry

PS As for light bulbs, I remember reading on the FRG-7 message board
(An ok resource, by the way:
www.insidetheweb.com/messageboard/mbs.cgi/mb325495) that a guy was
able to find model railroad bulbs that were perfect replacements.

1102. FS: Heathkit 10-10 Q-Multiplier

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-22 20:16:54 UTC
From: macve3gro@aol.com
Message-ID: <20010122151654.21704.00000772@ng-mj1.aol.com>
Source record: 65677

I believe this is the last model Heathkit made. It is relatively rare. Unlike the early easy-to-find units, the 10-10 has a built-in power supply, permitting it to be used even with AC-DC receivers. Knobs and front panel are perfect. Left side has a small, almost unoticeable scratch in the.grey-wrinkle finish. No documentation. Because of the condition of this unit (it is excellent), I am asking a premium price of $30 US plus shipping. Harry MacLean, VE3GRO, telephone 519-473-1668.

Source record: 65679

The dial says Radio College of Canada, but this unit is clearly a Heathkit BR-1 (the broadcast-only version of the famous AR-1 and AR-2) in disguise. Good condition. Wooden case, Roxatoned in the grand style of the fifties, is solid and clean but paint around the corners and edges could use some touching up. An interesting addition to anyone's Heathkit collection. $20 US plus shipping.
Harry MacLean, VE3GRO. Telephone 519-473-1668.

If you are talking about cw, fm, or am, just turn down the drive
(carrier) level. Mine will go down to 4 watts out (confirmed with a
watt meter).

Voltage regulator??

What kind of radio?

If the amp draw will be low (1.5 amps) you can use something like a
7812.

If you need more current then that you'll need to use something
beefier.

If the 24V system used 2 12V batteries in series (have seen it done), would it be possible to tap in between them and run the radio off of just one battery? Would they still charge OK?

That configuration is not recommended due to unequal battery loading.
Some form of regulator will be required.

Take it from those that have been there. Don't try tapping the
middle of the two batteries. Some where down the line when the
vehicle is started or the alternator is trying to charge a near
dead battery, you WILL BLOW the radio up.

When you use the center tap of the two batteries, you are relying
on the internal resistance of the two batteries to make the
voltage stay at the mid point of the input voltage. As the
batteries age, the internal resistance will go up. When this
happens, the center tap will not stay at the mid voltage point.
It will depend on which cells have the lower resistance.

If you must run the radio off of the 24 volt system, check out
Newmar and get a 24 volt to 12 volt power supply. You can get a
low current (1 to 5 amps) and then a high current power supply
for the transmitter. Tessco or Hutton are a good place to start
looking.

Source record: 65599

Hi, I received my FT-847 a few weeks ago, I love the rig. I also have
a Yaesu FT-102 (HF only).
Anyone who knows the 102 will tell you it has about the best receiver
that Yaesu ever made,
even compared to today's modern rigs (FT-1000's and such). I did some
simple testing or the receivers on the same
antenna via a A/B switch. To keep it short, I'm impressed with the 847's
HF receiver!!!
The 102 was and still is ahead of it's time, even without the bells and
whistles.

Just my 2 cents. Good Luck in your decision.

I'll second the above recommendation. That's the proper way to do it.
However, if you are installing a fairly low power radio, AND, if you
check the two 12 volt batteries regularly, you probably can get away with
tapping into the 12 volt battery that is connected to the vehicle ground.

Thanks. Even though I wasn'tthe original poster, I'm glad I learned about
something :)

1130. Re: Difference between 5/8 wave and 1/4 wave antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-23 02:34:13 UTC
From: "Stan Labinsky Jr." <stanbarb@warwick.net>
Message-ID: <3A6CEDA5.A6DEB09E@warwick.net>
Source record: 65607

The quarter wave antenna is nice if you have to park in low overhead garages or just want to be unobvious or if you intend to work local only.
As regards the 5/8ths wave, the first volume of the ARRL Antenna Compendium has a review that looks at the relative deficiencies of the 5/8ths. reference a halfwave antenna in the same installation.
The 5/8ths and the half wave (if mounted over a good groundplane) provide "gain" by squashing the signal in the vertical plane, making it appear to "reachout" farther. Note, the groundplane should be a quarter wavelength in all directions... like on the top of the car roof, etc.
As far as the spring is concerned, if your antenna is going to be hitting lots of tree limbs, use one. If not, forget it. The more "goodies" you have out in the open, the more that can fail. The shock spring should have a jumper inside the turns of the coil of the spring, if it's not there or if it has come unconnected, the spring WILL behave as an inductor, retuning and ruining the antenna for your purposes.
I see this with a "name brand" (you'd recognize it easily) commercial antenna used for the VHF "lo-band" service, that's just below six meters. After a year of living on top of a school bus, smacking into every tree on the route, the spring must be replaced! It's still mechanically fine, but the antenna just will not tune up. How badly mistuned the antenna will be is determined by how dirty the individual coils of the spring have become, so it can vary... intermittents are so much fun!!!
As far as "how far will each of the antennas go"? Well somewhere between two to three times the quarterwave... usually. But I've spoken to folks who have to go with the quarter wave because they live in rather mountainous terrain. That squashed signal works well in the valleys, but just doesn't make it up and over the hill to the repeater. So, it all depends.
Hope I've helped. Stan

1131. Which to buy

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-23 02:47:06 UTC
From: "Stan Labinsky Jr." <stanbarb@warwick.net>
Message-ID: <3A6CF0AA.17C2CE31@warwick.net>
Source record: 65609

Hi, I'm looking for opinions on which would be the better HF rig to buy. I've just about centered on either the Kenwood TS440, or the Icom IC735. Assuming the same price which is the more for the money? How do the features / capabilities compare? My budget is in the $500 US range... is there another rig I should consider?
I'm not looking to start a flame war here, I'm not looking for "this one is junk", etc. everybody's mileage does vary! I'm asking for comparative facts. Both rigs are "supposed" to be decent.
Thanks, Stan

1132. FA:SONY ICF-2010 Air/FM/LW/MW/SW RADIO

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-23 02:47:50 UTC
From: schlomo <schlomo71@my-deja.com>

Source record: 65610

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1209768564

Sony ICF-2010
covers AM (LW/MW), FM, Shortwave (w/USB & LSB for SSB)& Air
continuous coverage from 150-29999.9Khz, 76-108Mhz, and116-136Mhz
dual conversion receiver with quartz digital synthesis tuning
32 programamble memory presets
tuning: direct entry keypad, memory scan, or with dial
fast/slow dial tuning with lock setting to prevent accidental station change
syncronous selectable sideband tuning on SW to eliminate interfernce on
ajacent frequencies
narrow/wide bandwidth switching
clock w/ 4 programmable timer (alarm) settings and sleep button
LCD read out for frequency, time & memory channel number
green& red led's for battery level indicator and tuning meter
includes: external antenna w/ jack adapter, ac power adapter, sholder
strap, and owner's manual
requires 2 'AA' batteries for memory & cpu & 3 'C'batteries for portable
operation
This unit is in perfect operating condition. Minor cosmetic
imperfections: there is a bit of dust under the display glass, some
small scratches can be found on the unit, and the attached telescoping
antennais missing its tip.

Guaranteed NOT DOA. Buyer to pay actual UPS shipping plus insurance.
Paypal accepted.

On Jan-12-01 at 18:46:00 PST, seller added the following information:

Someone asked about tuning accuracy.

According to page 11 of the manual:
"...frequency is tuned in and displayed at the following intervals,
depending on the bands.
AM: 0.1 kHZ (w/the manual tune mode set to slow)
1 kHZ (w/ the manual tune mode set to fast)
FM: 0.05 MHZ
AIR: 0.025 MHZ"

Source record: 65613

The Motorola mikes are biased in a similar way to ICOM. Usually from 9.6 volts
via a 1K resistor. Might work OK if the gain is matched.

I haven't owned either one, but I can pass along a suggestion which might save
you some trouble if you ever want to operate on the new digital modes. Be sure
to get a rig which allows you to select any of the filters while in either LSB
or USB mode. It is important to be able to narrow the bandwidth down from what
is normally used for voice. Good luck.

Excellent, excellent and yes. I have no idea how the HS-706 compares to the
Pro-5.

You can buy other desk mics from Heil for the Icom. They make all kinds of
stuff: foot switches, booms, adapters, interchangeable elements, etc.

I won't repost everything that Pete said, but I thought he was talking about
my concerns with ICOM. Big problems with the 211 (way back when it was new)
also and with the little "all band " hand held receiver. ICOM has left such
a bad taste that even today I think three times before buying ICOM as used
equipment for $0.05 or less even if it is currently in working condition !

OK, Ben, these mics typically wire up this way:
The audio comes out on pin 5 of the Rj45 plug, P.T.T. on pin 6, Ground on pin 4.
OK, which pin is which? Easy, pins 1 and 2 have no wires running to them.
The audio line will require about a 600 ohm resistor (560 works very nicely) to a quiet source of 5 volts. If you had to, you could use an external 9 volt battery, but I'd sooner get it from inside the rig. If the input (at the mic jack) is capacitively coupled to the amplifier input, and it should be, just connecting that "pull-up" resistor inside the radio at the mic jack should do the trick. Some of these desk mics have a volume control inside them, accessible through a small slot in the back of the mic, unwind the end of a paper clip and hammer the end flat to make an adjusting tool for it.
If you don't want to cut off the RJ plug, you can buy a surface mount wall jack and use it as an adapter to the rig. Just make sure that it's the 8 wire model... I use one to adapt to an audio amp to test out mics like these.
Actually, I suggest that you do it that way... each conductor in the mic cable is made with "tinsel wire", which is made up of a flat ribbon of copper wound around a nylon thread. Very flexible and lasts a long time in normal field use but a real bear to solder into a mic plug.

I'm not familiar with the motorola mike, but if it requires a voltage I
assume it's a condensor. If thats the case, he would have no problems
with the 706 as it uses a condensor as the stock hand mike. Pin 1 on the
modular 8 pin plug on the radio supplies 8 volts. There should also be a
voltage on the audio line itself I think as I notice the hand mike does
not connect to pin 1. In fact , I know there is as it's powering the
preamp I'm using for my mike. The mike audio in is pin 6. So to match
from your description to the 706, pin 5 on the rj45 would match pin 6
on the radio. The PTT on the mikes pin 6 would match pin 4 on the
radio.The mike pin 4 ground would match pin 7 on the radio. The mike
ground pin on the radio is pin 5. For that rig/voltage and a eletret
element I'd probably use about a 2k resister instead of the 560-600 ohm.
Thats what the stock hand mike uses. Of course to do this he'll need a 8
pin modular plug to match the rig. I used a "quick snap together"
version I found at radio shack. They aren't cheap, but I didn't feel
like spending 30 $ for a crimper. I probably should break down and get
one though being as all the new rigs are going that route. I used a
short piece of ribbon cable to hook onto the plug, and connected the
mike leads to that short jumper. Most normal mike wires are too fat to
fit a modular plug. BTW!!! Never ground the voltage from pin 1. It'll
blow the regulator. I just rigged up a desk mike for mine, but I used a
dynamic and needed no voltage except for the preamp. And only a little

bit of preamp was needed. I couldn't quite get full drive without it with my 200 ohm dynamic mike. MK

I sent an email to the VE and he offered to let me take
the extra class exam in February for free. That's fair
enough for me; it gives me more time to study!

FS: Icom IC-2800H Dual Band Mobile Transceiver with box and all accessories.
MARS/CAP modded. Works and looks great. Sell For $450 plus shipping

GENERAL SPECIFICATIONS:
Dimensions (projections not included): Controller: 140(W) x 70(H) x 34(D) mm
or 5-1/2"(W) x 2-3/4"(H) x 1-11/32"(D); Main Unit :140(W) x 40(H) x 165.8(D)
mm or 5-1/2"(W) x 1-9/16"(H) x 6-17/32"(D)
Frequency Coverage (MHz): (VHF) Tx: 144-148, Rx: 118-174*; (UHF) Rx/Tx:
430-450** [*Guaranteed 144-148; **Guaranteed 440-450]
Mode: FM, AM (RX only; 118-135.995MHz)
Memory Channels: 232 (inc. 12 scan edges, 10 log, 10 repeater and 2 call)
Tuning Steps: 5, 10, 12.5, 15, 20, 25, 30 and 50kHz
Frequency Stability: ±10 ppm (-10°C to +60°C;)
Power Supply Requirement: 13.8 V DC ±15% (negative ground)
Current Drain (VHF/UHF; at 13.8 V DC): Transmit Max Power: 12.0A / 11.0A;
Receive Standby: 1.2 A; Receive Max Audio: 1.8 A
Antenna Connector: SO-239 (50)
DATA Connector: Mini DIN 6-pin
External VIDEO Input: PHONO [RCA (75)]
Weight (approximate): Controller: 290 g/10.2 oz; Main Unit: 1.15 kg/2 lb, 9
oz

TRANSMITTER SPECIFICATIONS:
Modulation System: Variable reactance
Output Power (VHF/UHF): High* 50 W/35 W; Mid-H* 20 W (approx); Mid-L 10 W
(approx); Low 5 W (approx)
Spurious Emissions: -60 dB
Microphone Connector: 8-pin modular (600)

RECEIVER SPECIFICATIONS:
Receive System: Double conversion super heterodyne
Intermediate Frequencies: 1st 15.65MHz (VHF), 46.05MHz (UHF); 2nd 450kHz
(common)
Sensitivity: 0.16µV typical (at 12dB SINAD)
SQL Sensitivity: Less than 0.13µV (at threshold)
Selectivity: Wide: More than 12kHz/-6 dB, less than 28kHz/-60 dB; Narrow:
(Europe/Italy VHF only) More than 6kHz/-6 dB, less than 18kHz/-60 dB
Spurious And Image Rejection Ratio: More than 60 dB
Intermodulation Rejection Ratio: More than 60 dB
Audio Output Power (at 13.8 V DC): More than 2.4 W at 10% distortion with an
8 load
External SP1 Connector: 2-conductor 3.5(d) mm (1/8")/ 8

External SP2 Connector: 2-conductor 3.5(d) mm (1/8")/ 8

>Both rigs are "supposed" to be decent.
>Thanks, Stan

Well, if you insist on comparative facts, you can go to
http://www.arrl.org and read the QST lab product reviews for each rig
(you need to be an ARRL subscriber to access the product reviews).

You can also go to http://www.eham.net and look up personal reviews on
both rigs for free -- look under Product Reviews/HF Transceivers.

I personally have a 735, and it is certainly one of the better rigs
ever made in its price range. Will do most anything you need, if
you're just starting out -- or even if you're a seasoned ham.
Excellent receiver. Controls are nicely laid out. Very good on CW.
Works fine on SSB. Has FM built in, if you're into the 10-meter
repeaters. With the narrow CW filter, it's quite nice on CW.

The Kenwood rig is a good one, too, and certainly was popular in its
day.

You might have to flip a coin between the two, or just buy whatever
you can find that is in the best condition.

Good luck!

Bob

Looking for a manual in PDF format on the
Kenwood TM-733 Dual band radio. Need the
sequence to write from the VFO to a memory
channel. Not intuitively obvious.

Thanks,
Dave - W9BOI

I've used (and worked on) the TS-440 rig. Pretty easy
to work on if you like to tinker. But, these radios came
with an inherent manufacturing fault. THey used hydroscopic
(meaning, absorbs water from the air) to pot the components
in the VCO's. Meaning, after a number of years, this goo became
brittle and conducted electricity, effectively shorting out
components. In doing so, the VCO's would unlock giving the
display the unlock code of ".....". The only way
to fix this (and fix it right) is to remove all the components,
dig out the goo, replace the components, and retune the VCO's.
If the radio you're looking at has had the modification done
to remove/replace this goo, once done it's done. If it has NOT
had this procedure, you're looking at a $150 to $400 job to get
it done, depending on which VCO is having trouble (there are 2
areas (VCO1 and VCO5, I believe).
I have no experience with the IC-735. Spend a few bux more, and
buy a used Yaesu FT-990 rig. Best rig for the used dollar, IMHO.

Good luck,
Vic

watch your dealings with seth@mbox306.swipnet.se Mangus Berntsson. He made a deal to trade a kenwood 742E for my alinco DJV5TH. He said he sent the item out oh about 15 days ago airmail. I sent mine via the co. i work for AB express. There were a few emails asking where the item was with pretty much he didnt know. I put a hold on my ht in sweden thank goodness I work for the Co. Anyhow now he says oh his postoffice never sent the item he really doesnt know why? Gee mm,. I really dont thing the fellow sent it. So I canceled the deal. And my HT just had a nice joy ride around the world. This guy says he will cancel his shipment which we all know is impossible if it was shipped out via air mail. Just becarefull guys and gals dealing with this fellow. i am not saying he is a big scamster but sure seems very very fishy to me.

Greetings from Texas!

With all of the "Bad Guy" alerts being posted these days,
telling us who we shouldn't deal with, I thought it would
be beneficial to tell you who you should deal with!

I just completed a deal with Chris Katsoufis, VE3NGW/W4,
in Florida. I bought a Drake 2B/2BQ that he had posted
on the newsgroups a couple of weeks ago. The equipment
was exactly as he described it (both cosmetically and
functionally), he shipped it in a very timely manner,
and his email communications were friendly and timely.
I would not hesitate to deal with Chris again.

"zl2bmh" <zl2bmh@free.net.nz> wrote in message news:980139224.687033@news...
Hello All.

I have a problem with my Samsung Dot Matrix SP2412 Printer. While printing
in one of the digital modes today the paper got tangled and I had to close
the printer down. At this stage I was halfway through a long printout
When I went back to the page where the trouble started my printer started
printing from page 1 again.

Is there a way to start printing again from where I had the trouble?

Many Thanks
Jim (ZL2BMH)

Source record: 65559

I just unpacked my old Simpson 260 VOM after 3 years in a moving box, and guess what? Forgot to take the batteries out and wound up with the D Cell clip all coroded away. Ick!

Does anyone know if Simpson is still in business and where to maybe get a new replacement clip for this?

Oh, and by the way, I came across a 2 meter VHF mobile power amp, I think ity takes 40 watts in to get 120 watts out. Is this worth anything, if I tested it & went to sell it?

Their products are still being sold by the major catalog companies. A web search should find an address for you.

You might get faster response by finding a meter service and calibration company.

Another cheaper suggestion is to solder the wire directly to the battery and shove some cardboard in place of the clip to keep the battery from moving around. You only need to do this every 3 years or so, but the clip won't be corroded away each time !

If you'd rather let the battery be user-serviceable, you can fashion a clip with almost any small piece of metal and some silicon sealant. Attach the wire to the piece of metal, put some silicon sealant on the plastic mounting tab, position the metal piece roughly where the original clip was, and find a way to keep it there for 24 hours. When done, the metal should be able to move a bit as you insert the battery. You can easily remove the metal piece if necessary in the future.

Hope these ideas help.

1190. Vertex VX-800 Question

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-24 11:19:11 UTC
From: noah824@att.net
Message-ID: <PSyb6.6911$7b2.506833@bgtnsc05-news.ops.worldnet.att.net>
Source record: 65566

I realize that the VX-800 is a fairly new radio, but I'm sure someone out there has some experience with them, or has access to them. Hopefully if you do you're reading this!

I have a VX-400 radio and my biggest complaint is the priority sampling. Not the timing, as I know that's adjustable, but when it keeps switching back to the priority channel the non-priority traffic gets quite chopped up. It's very deep, unlike the hardly noticeable "tick tick tick" of Motorola's sampling. (I switched to a VX-400 from an HT-1000)

Since the VX-800 seems to be basically a 400 with more options, I'd like to know if the 800 has that same deep priority sampling problem.

Thanks for your help.

Noah

Hi Jim -- don't know of any calendar that specializes in SSB, but my
favorite HF contest calendar is by LA9HW at URL:
http://home.online.no/~janalme/hammain.html
Covers just about all known contests by month and includes the rules. It
is easy to spot which ones are SSB as it contains a mode column.
Good luck in the contests

The mod you performed is correct for the USA model (A1). Since the
various models (A1, A2, A3, B1, B2, B3, B4, C1, C2, C3, C4, D, H1, H2,
H3, H4) are controlled by the jumper pads, you will be able to get your
to work like your friends by making sure all of the jumper settings on
your radio, not just J13, are identical to his. If this cannot be done
I might be willing to open my radio and get you the jumper settings for
the A1 model. However, see if you can get his settings first since it
sounds like he has the configuration you are interested in.

1196. Which extra SSB filter for TS-850?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-24 15:04:53 UTC
From: ignacy@num.ads.uga.edu
Message-ID: <3a6ef193$8$vtanpl$mr2ice@news.uga.edu>
Source record: 65572

I am considering the addition of an 8.8 MHz extra SSB filter to my TS-850.

With crude measurements, the current one is about 2.7 KHz at -3db and about 5 KHz at -60db, well too wide for tougher conditions. Has anybody raplced this one with a narrower filter or added extra SSB filter in the optional slot? Any problems with all low or high tones cut completely? Which one of the INRAD filter is better: 1.8 or 2.1? Do INRAD 8.8 KHz filters fit in the optional slot?

I replaced the 455 KHz ceramic SSB filter with the crystal one (2.4 KHz at -3db, 3.8 KHz at -60db) from Kenwood. The slope is much better but it took some time to reallign the filter and the signals sound less natural than previously. A good feature of TS-850 is that this filter can be switched off for better fidelity if signals are really strong.

I appreciate any comment!

1201. FS: Ten-Tec Omni D, version B

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-24 19:52:06 UTC
From: dslosty@pipeline.com
Message-ID: <3a6f31db.10770496@news.pipeline.com>
Source record: 65577

For Sale: Ten-Tec Omni-D, version B transceiver.
Incudes the original model 252Mo 12VDC, 18 amp
supply, also the audio CW filter but has no xtal
filter options installed. Manual is included.

I've added the Ten-Tec WARC band kit for 30 mtrs
but xcvr doesn't have 17 or 12 mtrs.

The unit is in excellent working condition with an
almost perfect front panel.. Asking $375 plus shipping.

I've used the rig for a couple of years. It's great
on SSB and QSK CW. However, I've got two more
Ten-Tec rigs and this is a duplicate that I don't need.

73,
Doug/WA1TUT

Hi,

I'm new to the Syntor X series... what is the correct way to hookup the radios to power? I followed the steps at http://www.open.org/~blenderm/syntorx/indexx.html and have concluded that I have a negative ground system with no abnormal jumper settings. I programmed the module with ham frequencies. I know that the red goes to positive and the black to negative... but what about the green and orange wires? I know they enable the transmitter. But do they go to ground or +? All leads are fused and the fuses checked out on the multimeter.

Thanks for you help,
Peter Gogas - W1AGG

I have for sale on Ebay at no reserve this soldering station. Ebay item number is 1209865528. Its a great deal!!

This new UTC 200HC (high capacity) is an ideal station for continuous production soldering. The soldering pencil uses a heater and sensor combination that allows for quick heat-up and recovery. ESD safe to protect sensitive components. Slim, comfortable hand piece - reduces operator fatigue. **Variable Temperature** **ESD Safe** **Precision Electronic Soldering** **Accurate Electronic Temperature Control** This has never been used.

On most Motorola radios, Green wire goes to +12 volts, for the receiver. Orange wire goes to +12 volts for transmitter enable. Large red wire goes to +12 volts battery (always on) and powers TX PA and somtimes audio PA. Large black is battery negative. (For Neg. ground only.)

They go to the + side. One is RX power the other enables the
transmitter.

1220. FA Small Wonder DSW-40

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-25 04:06:21 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <94o8omrs1@slb0.atl.mindspring.net>
Source record: 65597

For Auction DSW40, This has become a classic in the QRP group. The DSW-40 is a digitally tuned 40 meter superhet CW transceiver. With a pc board of 2.8"x4.0" it features shaft-encorder tuned operation with complete coverage of the 40 meter CW band, 7.000-7.150Mhz. It offers Full QSK, and Direct Digital (DDS) Synthesis approach. The heart of this tiny transceiver is a PIC 16C622. Features shaft-encoder interface, DDS frequency management, RIT management, "Frequency-mite" Morse audio readout (actually gives you the frequency in Morse Code!) and Iambic Keyer!! Filering is accomplished by crystal filters! Power output is 2-2.5 watts! Since the picture was taken, a Red LED was added to the front panel. Using this "rig" you will forget it is not a big rig, but is actually powered by a "wall wart". Buyer pays shipping from Chicago area. In good condition, some wear on 'Yaesu lettering' on base of microphone. First $125.00 via PayPal gets it. Works perfect. I just got it in the mail today, but am trading my FT-767GX/CAT so have no need for it now.

Also for sale a set of 'hamstick' antennas made by Valor. I have the 15, 20, 40, and 80 meter sticks, complete with whip and Heavy Duty spring. First $90.00 via PayPal gets 'em.

Hybris (Also known as Win32.Hybris)
Win32.Hybris is an e-mail worm which modifies WSOCK32.DLL to intercept outgoing messages in a
manner similar to Happy99 (which is also known as SKA).

However, what differentiates Hybris is its ability to update itself and extend its functionality using
"plugins". This means that what began as a simple e-mail worm can mutate, complete with new
methods of spreading and avoiding detection.

The body of Hybris contains the basic functions required for infecting systems and propagating
through e-mail. When the worm is run, it immediately attempts to modify WSOCK32.DLL in the
Windows System directory. If the file is in use, it will create a modified copy and modify WININIT.INI
so the infected copy will replace the original the next time Windows is started. The temporary copy
of WSOCK32.DLL is given a random filename consisting of 8 capital letters from A to P, for example
"AFFJOPPF".

The modified WSOCK32.DLL intercepts connections made and data sent and received by the host. It
searches the information looking for e-mail addresses. After some time, and after checking that
there is an active Internet connection, the worm will send its own e-mail message to the addresses
it collects. The message will include a copy of the worm as an attachment.

The "From" and "Subject" fields, along with the message body and name of the attachment are
almost infinitely variable, as they are derived from one of the plugins, called "text". The earlier
versions of this plugin would set the subject to:

"Snowhite and the Seven Dwarfs - The REAL story!"

The body would be set to:

"Today, Snowhite was turning 18. The 7 Dwarfs always where very educated and polite

with Snowhite. When they go out work at mornign, they promissed a
huge surprise.
Snowhite was anxious. Suddlently, the door open, and the Seven
Dwarfs enter..."

The filename was randomly chosen from the following list:

"sexy virgin.scr"
"joke.exe"
"midgets.scr"
"dwarf4you.exe"

There is also a "text" plugin which has a similar message and similar
filenames, except they are
also in French, Spanish or Portuguese depending on the language of the
host system. Another known
"text" plugin will generate the subject and body randomly from a list of
words such as "sex",
"horny", "pleasure", etc.

The other most common plugins include one that downloads new plugins
from a web site, and one
which can send and receive plugins from the alt.comp.virus newsgroup.
This enables the worm to
automatically keep up-to-date with the latest available plugins. The
plugins are retrieved and stored
in encrypted form and decrypted when needed. The worm supports up to 32
different plugins.

One of the Hybris plugins, called "avip", will block access to
particular web sites related to
anti-virus organizations, based on their IP addresses. For example,
infected machines will not be
able to connect to:

www.vet.com.au
www.nai.com
www.sophos.com
www.pandasoftware.com
www.kasperksy.com
www.wildlist.org
www.symantec.com
www.irisav.com
www.antivirus.com

Please note that this is not a complete list. Also, due to the way the
plugin checks IP addresses, it
may also block access to other web sites which are not anti-virus
related.

Another plugin worth noting is the "spiral" plugin which displays, on
the screen, an animated spiral
graphic image. The image covers much of the desktop and is next to

impossible to close, due to the
way it hides its process. If the date is the 16th or the 24th of
September of any year, or it is the 59th
minute of any hour in the year 2001, the plugin drops a file in the
Windows System directory and
adds this filename to the "run=" line in WIN.INI. The filename is
generated randomly, but will always
be 8 letters followed by the extension ".EXE". Once this executable is
installed, it will display the
spiral every time the machine is restarted.

There are also plugins available that encrypt the worm with a
polymorphic encryption loop, infect
DOS and Windows EXE files, and to add the worm to any .ZIP and .RAR
files on the hard disk. The
plugin that infects Windows EXE files sometimes corrupts the files; the
infected programs will often
crash and are not cleanable.

Cleaning:

For VET and InoculateIT Personal Edition customers
The latest virus engine with the latest virus signature files installed
will clean WSOCK32.DLL and
any other files infected with the Win32.Hybris worm.

To clean the virus from your machine you should:

1.Perform a full scan of your machine.
2.When prompted by VET/IPE, reboot your computer.

If the worm has badly corrupted any system files and VET/IPE is unable
to clean them, you will need
to replace the corrupted copies of the file/s with clean copies.

For Inoculan customers

To clean the virus from your machine you should (with your up-to-date
software):

1.Use cleaning mode to scan all files on your computer.
2.If there are errors curing the EXE files, make sure that the
applications are not currently
running. If they are, close the infected applications and cure
again.
3.If you still have errors curing the files, replace them from
backup.
4.If there is an error curing WSOCK32.DLL, close all the applications
that use the Internet
(Internet Explorer, Netscape, ICQ etc) and cure again.
5.If this is unsuccessful, reboot into DOS mode and cure WSOCK32.DLL
using Inoculan for DOS.

[One or more binary attachments are retained only in the source text.]

> Any ideas ?
> Den vk2xar

The IC-211 has problems with the poor quaility circuit boards used.
Especially the holes that were not plated through very well. You can
often fix the type of problems you mention, by soldering little wires on
both sides of the vias.

Best of luck with it!

Hi Paul,

I used a 14AVQ and an 18AVT in the past (long ago). The antennas were well constructed and I had no problem tuning them. However, their performance can't hold a candle to the performance of the Butternut HF-6V that I've been using for the last 16 years. It's a real booger to tune, but once tuned, it's a great antenna!

It is nice you want to help but, that is what anti virus is for,
even if one of the new ones infects.

All the bandwidth used by virus alerts and back and forth is wasted.

As you posted, www.synamtec.com is a good resource as well as the
us govt. virus site.

I have a Q7a for sale. It is new in the box (never used), I got it for Xmas and
I already have one. I will sell it with a Maha 4 AA charger (used once to see
if it works) and a 8" dual band wire like antenna (new never used). This
package
would cost $175 new at AES but my price is $130 shipped. Please email me
if interested.

Selling my Icom 2800H expanded coverage, on Ebay.

Just wanted to make you aware of my auction. My reserve is $400.
I paid $510 for this, and it's almost new, not the mention the
difficulty(tinyness) of the mods already completed. (www.mods.dk)
This now covers many freqs of interest to scanner buffs as well
as hams. You won't need two radios in your car now.

From: radiotek@pacbell.net
Message-ID: <3a7097e1.3247633@news.nvbell.net>
Source record: 65522

Hello,

I am looking for ANY information on the Heathkit Model MWW-23 Marine Radio Transceiver. What I know is that it covers 2-3 MHz and BC Band RX. I am possibly looking for a manual and/or schematics. Any help would be great. I also need to know if this operates off of an external power supply or what voltage it operates off of (Direct)?

I have the rig apart, and I am almost certain that it has a built-in power supply. Also, judging by the PA Tube being 12DQ6, I would say that it runs off of 12/13.8 VDC. Any help would be nice. You may Email me or call me:

E-mail: radiotek@pacbell.net
Phone: (661) 272-6949

Thank You & 73,

Mike KQ6MU

Please make sure you obtain a copy of a valid amateur license from your buyer
before selling this item so an illegal keyclown (see rec.radio.cb) doesn't
get it. Have a nice day.

Well smartass, if its so effective, why do I and dozens of others have it sent to us every day...probably because some super smart computer guy like you says it "cant happen" that way right? In case Im not being clear to you, I dont think you know what you are talking about and it was not a waste of bandwidth, already two have found it and reported and gotten rid of it for my post... Sorry that it invaded your privacy, but I was taking a wide sweep trying to find those few who are not familiar with all this..im no virus expert, but I have become familiar with a specific problem out there , particlarly in the ham community....ONe of em is inexpereinced computer operators with OUT virus protection or training...and the other is smartass's. Im one and so are you!!

The 75-ohm line is an electrical quarter-wave at the center of the
20-meter band.
Contact Butternut and they not only can tell you but will probably be
happy to send you the documentation for the antenna.

That line section is really not needed except for 20 meters and even
there you may can get along without it.

I would try the antenna without it and see what 20 looks like.

I tried mine with out the matching section and it worked okay as long as I used
an antenna tuner. High vswr otherwise.

Anyway, on page 17 of the pdf file from the bencher/butternut website you can
find the specific dimensons.

http://www.bencher.com/pdfs/00366IZV.pdf

Check out the www.bencher.com website for other butternut antenna info.

In brief, I have a multi element TV antenna with a amplifier connecting to 4 televisions. The house lot is laid out in such a way that it's very hard to string antennas up with out having them in close proximity to the TV antenna. Cable is not an option. Satellite is possible but would like to keep regular TV antenna.

At Christmas I found a Six Meter rig under the tree.(MFJ 9406 SSB/CW 10 Watts) which my wife gave me. I put up a dipole to try it out and to my surprise it works quite well. With a antenna tuner I have a 1.3:1 SWR.

My wife hasn't stopped yelling at me sense. Every time I key the mike or try out CW the TV's go blank. I have tried a HI PASS filter but that doesn't do much good at all.
My HF rigs cause no problems at all. I do have a good RF ground

WHAT AM I DOING WRONG??? HELP!!!

Any comments and suggestions would be gratefully appreciated.

Thanks

This is a kit, brand new, unopened. See it here:
http://ramseyelectronics.com/hk/hobbykits.htm

. Synthesized 88 to 108 MHz for no frequency drift!
. Professional quality for exercise clubs, realtors, drive-ins
. Strappable for higher power output
. Microprocessor controlled
. The ideal campus or school radio station

I would rather give someone a bargain here than mess with EBAY. (I would accept PAYPAL for payment, however.)

Ramsey charges $129.95, my minimum price $50 + 7.50 shipping. Serttle then ship. Email offer to - cwgee (at) therange (dot) com, then I'll respond to each in one week.

I'm currently using a plastic straight key with metallic contacts.
Its a bit odd, somewhat flimsy, and starting to mis-send
characters. I think this key was part of some toy or something
at some time in the past. Not even sure where i got it.....

Anyway, i'm looking for suggestions for a replacement. I've never
used anything but this straight key. Iambic paddles? Bug?
This is foreign stuff to me. So, any suggestions? Oh yeah,
one other restriction: i want something cheap. :)

But it evidently doesn't clean it from your system.I just received the virus message again, and Norton set a message that said it was present but Norton couldn't clean it and that I should Quarantine it. So I just hit the delete key again,then emptied the trash folder.
I just bought Norton Systemworks 2001 and will see how that handles it.

If you don't have a keyer, either built into your radio, or an external keyer, paddles won't do you much good.

A bug takes practice, practice, practice.

If you are learning CW and are seriously interested in learning it, invest in a GOOD straight key. Expect to spend $30-40. Nye Viking is a good brand. There are probably others.

While you may kick about spending 30-40 for a straight key (you might find one cheaper on E-bay or some place like that) remember that if you take care of it, it will last a lifetime. I have an el cheapo, bottom of the line Nye Viking, mounted on a homebrew plastic base. Paid $16 for it in 1977. Still in use, and good as new.

I also have a Vibro-Keyer that I bought as part of an estate sale. Its serial number shows it's around 1959 vintage. That, too is in excellent shape.

Good keys and paddles don't wear out. They will last forever, as long as the screws are kept as they should be and you don't step on it.

I think I'm familiar with the key you may have -- is it one that was given away with old Heathkit oscillators? I had one, I threw it away.

Anybody using broadband antenna amplifiers are just asking for
trouble. If it has a frequency response something like 47 .. 860 MHz,
then there is no wonder that it is going to saturate :-).

Are you absolutely sure you need amplification for VHF channels ?
Wouldn't it be sufficient to put a UHF only amplifier directly after
the UHF antenna and just use a passive summing network to connect the
VHF antenna into the downlead ?

If this is not possible, but Band I is not needed (channels 2 .. 6 in
the USA), put a high pass filter around 150 MHz immediately in front
of the preamplifier.

If Band I channels are required, put a 50 MHz notch filter immediately
in front of the amplifier and make sure the amplifier has a good
metallic cabinet so that your transmitted signal does not go directly
into the amplifier.

i agree, when i sell a amp it prove you have a ham license or take a
walk too much cb crap showing up on 10 and 12 meters as it is.of course
not having a amp wont prevent them from out of band operation but at
least they wont have a biggg sig.

Hello all Drake enthusiasts!

This year's Drake Forum will take place at the Dayton Hamvention, Ohio, Saturday May 19, Hara Arena, Room2, 9:45-10:45.

There will be a raffle of a Drake TR-44B Communication Station, and the drawing will be at the Drake Forum. Maybe you'll be the lucky winner of a near perfect TR-44B ! Only 150 tickets will be sold. Tickets are still available. Well, you have the opportunity now. For more details and pictures, take a look at http://home.online.no/~sindtorp/raffleTR44B.htm

I hope to meet many of you at the Drake Forum, Dayton Hamvention 2001 !

Sindre, LA6OP

Hello All,

I'm looking for a service manual, or at least the alignment procedure, for a
Realistic DX-160 shortwave receiver.

Thanks!

Bob

immediately
> in front of the amplifier .....

You can make a good inexpensive notch filter by placing a 1/4 wave (on your 6M operating frequency) long piece of coax, shorted on the far end, across the input to the amplifier.

So what? This rig does not transmit on the cb frequencies.

What good will that do ? I thought a 1/4 wave translated a short to an open.

Message-ID: <2Xfc6.1579$CQ4.166743@monger.newsread.com>
Source record: 65468

I have two of those antenna's and the 75ohm feedline can be between 13' and 20'. And as others have told you, its for tuning the 20m band. I use the MFJ meter at the base of the antenna to tune all bands, and then do 20m last. Depends on the soil, radials, etc. as to the exact length.

Its not the worlds greatest antenna on 20m anyway, so I don't even mess with it anymore. But, on 10, 15, 40, and 75/80 I've worked the world with it, depending on the conditions and the cycle.

Once you get all the bands tuned, it will stay that way. Keep the antenna sections snug and use some nylon guy lines on it about four feet or so up 'if'' you have winds like West Texas or Colorado.

OK- i do have a keyer built into my rig. Alinco DX77T has the
keyer as standard. Oh,yeah i guess i didn't mention the rig before.

> If you are learning CW and are seriously interested in learning it,
> invest in a GOOD straight key. Expect to spend $30-40. Nye Viking

> a good brand. There are probably others.

Well, i'm always learning CW since i'm always trying to get better.
I've been learning it for 7 years. :) $30-40 is OK. I just want
to stay away from the flashy $200-300 keys. I don't quite understand
how something so simple can cost so much!

> I think I'm familiar with the key you may have -- is it one that was
> given away with old Heathkit oscillators? I had one, I threw it
away.

Hmm... i really can't say. I acquired a Heathkit HW9 some time
back, and maybe this key was included with that. I really can't
say for sure.

OPEN on the far end!

Best use a piece of 'large' coax. I've used 3/4" cable TV hardline.
It's notch is wide enough that you should cut it low in freq. to keep
from killing any TV2 signal. Cut it for 49 - maybe 48 mcs --- you
can always cut long coax shorter, but you can't cut short coax longer.

Make that 1/2 wave and you might see a notch :-) on that frequency
(and remembering to compensate for the velocity factor) if you are
using shorted stubs.

A 1/4 wave _open_ stub could also be used, but it is harder to tune.

Is that why it is listed as ONE of the TOP TEN?

try www.symantec.com and http://vil.nai.com/vil/dispvirus.asp?virus_k=98873

You may become more informed

I've gotten it over a dozen times in email. My antivirus and other things
keep it blocked out.

Hi,
Has anyone got the DC converter for the TS-830S that permits
the transceiver to tbe powered from 12V battery supply?, must
be in good working order. I need to go /p but an additional rig
is out of my budget !

Message-ID: <3A72054D.9D66B7D3@flinet.com>
Source record: 65487

I have operated both and they are both fine rigs. I own an IC-735 which I bought brand new in 1987. It still runs as strong as the day I bought it. The two features I liked the most about it were the LCD display (I was running it mobile at first) and the continuous duty PA. The P.A. allows me to run RTTY at the full 100 watts with no problems.

On the other hand, the TS440 can usually be found with the built-in auto tuner. This was a feature not available on the 735. Other than that, I found them to be very close in operation. As long as you find one in good shape, I don't think you'll go wrong either way.

Thanks for reading my message.

I'm looking for a Icom IC-207H. Must be in excellent condition along with everything that came with the rig.

I have for possible trade the following item(s).

NEW - Less than 1 month old a COLOR Palm IIIc. Will include protective carrying case.

NEW - Less than 1 month old a GARMIN GPSIII + Also will include protective case (can be worn with belt).

If interested in either item for trade, please email me directly at ngwd@flash.net

1315. TVI 6 METERS

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-27 00:57:47 UTC
From: "David J. Moge" <n1rzb@mailops.com>
Message-ID: <3a72d6e2@excalibur.gbmtech.net>
Source record: 65369

In brief, I have a multi element TV antenna with a amplifier connecting to 4 televisions. The house lot is laid out in such a way that it's very hard to string antennas up with out having them in close proximity to the TV antenna. Cable is not an option. Satellite is possible but would like to keep regular TV antenna.

At Christmas I found a Six Meter rig under the tree.(MFJ 9406 SSB/CW 10 Watts) which my wife gave me. I put up a dipole to try it out and to my surprise it works quite well. With a antenna tuner I have a 1.3:1 SWR.

My wife hasn't stopped yelling at me sense. Every time I key the mike or try out CW the TV's go blank. I have tried a HI PASS filter but that doesn't do much good at all.
My HF rigs cause no problems at all. I do have a good RF ground

WHAT AM I DOING WRONG??? HELP!!!

Any comments and suggestions would be gratefully appreciated.

Thanks
DAVE, N1RZB

Sticking a needle through the shield and the centre conductor is a
reversible operation, cutting the coax is not a reversible operation.

Some of it is personal preference. The advantage of paddles (for me) is
that they are not as tiring as a st. key. And since the paddles will
send repetitive dits and dahs, it takes less effort. Again for me.
Others may have a different answer.

Hi,
I have a couple of VHF Saber III's with a variety of programming issues
and would like to ask someone who is very familiar with these radios a
few questions.

Thanks

Mike

I have the same car and have no significant, if any noise from the car. Your noise blanker should take care of the little ignition noise. I passed the hot lead from the battery through am existing grommet. I used a coat hanger with a "U" at the end. The lead was inside the "U". I grounded to the frame next to the fuse panel by the passenger leg area. 20 meters through 10 meters work very well. 40 and 80 are more of a challenge. I use hamsticks by he way. Rig is Knwd TS-570 with internal tuner.

OK. I need a quick overview of paddles. I think i knew that
some (or all?) paddles send dits on one side and dah's on the
other. Is that correct? You mention that it can send
repetitive dits/dahs. How does that work?

I've temporarily fixed my straight key with a touch of solder,
but i fear that after a little while of banging away at it, the
modified contacts will crumble. We'll see...

Paddles are used with electronic keyers. The paddles themselves are nothing more than two switches mounted attached to finger rests (shaped like paddles) on the same base. Early homebrew paddles used a pair of straight keys mounted base to base.

A "bug" will send a string of dits generated by a flexible metal blade with a weight attached to the end to adjust the speed. Dahs have to be generated manually on a bug.

I am looking at buying a TS-850S, however the ARRL review
mentions 2 issues.

First, apparently there is a 24Db attenuator in line for broadcast
band AM receive. What is your experience with broadcast AM receive
on this radio?

Second, the review mentions substandard SSB XMIT. Have
you noticed this to be a problem?

thanks for any advice

What is the joke here??? These are $169 brand new. The price was reduced
so low because the xmit audio is so terribly tinny its unacceptable and
can't really be fixed with the mod they recommend. It's a highly
uncollectable piece of junk.

I assisted with that review. The TS-850's SSB transmit performance is not a problem, but as I recall that we very unfortunately just happened to mention that its transmit IMD was a little higher than it might have been for the price. (Read the exactly wording; it's reasonably qualified.) "The street" zeroed in on our phrasing and turned it into the statement you've made. Especially considering that the TS-850S is a fine transceiver in every respect, we subsequent *greatly regretted* our choice of words in reporting the 850's SSB-transmit performance, and wish we'd simply omitted mention of the issue. So try crossing out that statement and rethink what you think about the 850S. :-D Had I the money at the time, I would have bought one without hesitation.

Hi

Cutting a stub to the correct length is like playing Russian roulette.
The alternative is to cut the stub shorter than the calculated length
either quarter or half wave and use a small trimmer capacitor. Use one on
the input to the Amp and one on the out put as well. My experience
suggest that most on the damage occurs in the TV set mixer.
you can locate a stub if necessary at the TV set as well. I have had a
good results with co ax and trimmer it is very easy tune. After a while
you can simply guess the length of coax and tune the trimmer.

1345. Re: Looking for Motorola Saber info

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-27 14:16:05 UTC
From: mjs <info4mjs@att.net>
Message-ID: <3A72D75F.72D8DAD4@att.net>
Source record: 65370

Per a recommendation from a fellow listener, my questions are as follows:

I received 2 Saber 3's that had a variety of frequencies programmed into them, ham radio, marine and weather. The radio's ID designates it as a narrow band radio however the range of frequencies programmed into it is certainly wideband. Upon trying to modify the list of frequencies, I have found that I can't TX or RX past 157 MHz.

Does anyone know if there is a way to use the standard RSS (ver6.xx) to program a narrowband radio as a wideband radio?

The radios also seem to have their squelch opened every 10 or 11 seconds for a brief moment, enough to make it quite annoying. Any ideas on how to prevent this? The maintenance feature in RSS (squelch adjustment) doesn't help this.

Thanks in advance.

Mike

Hi Chuck -- I owned a TS-850SAT for several years and always received excellent reports on my audio - and the Hi-Boost audio is a winner for breaking pileups. I tried several mics and the Kenwood MC-60 was my choice. And believe it or not -- the hand mic that came with the TS-850 was also very good. I recall working a JA with a TS-850 and his audio was superb -- I asked about his microphone and he said just the the hand mic. On the air tests showed the MC-60 and the hand mic were neck and neck - but preferring a mike stand -- I always used the MC-60. I found the speech processor very effective - packs in the audio.

On AM I could receive clear channel stations from all over the country (from CA). Modern receivers have a tremendous amount of gain - not always useful at the lower frequencies where atmospheric noise is prevalent -- so Kenwood chose to throttle back on the gain in the AM band. There is a mod somewhere in the MOD web pages to bypass this if you want -- I never found it necessary. See MODS links at URL:
http://ac6v.com/techref.htm#MODS.
You will have to search through the multitude of mods as I don't recall where I saw the attenuator mod.

Besides propagation conditions, for AM reception the antenna is the key factor in AM DX. I built a 32 foot vertical with a big big coil in the base and was picking up AM signals a bunch.

For more OPINIONS on the TS-850 -- see URL:
http://www.eham.net/reviews/detail/4

I bought a nice 850 this past summer. The attenuator on the broadcast band was a major problem for me, as I often listen to BC stations when working around the shack in the evenings. There's a published mod to eliminate the attenuator, and it works just as described. Pretty simple - just cutting a jumper on a circuit board. However, for old guys with big hands and poor close-in vision, it can get rather frightening working with these boards and their surface mount components.

There are some other good modifications to consider:

1. The tuning upgrade module from International Radio Service Division. A very simple one to install - no soldering at all.

2. The mod to make the CW sidetone level adjustable from the front-panel monitor control. Why it wasn't designed that way in the first place is a mystery.

My only complaints about the radio:

1. Contrary to popular opinion, the "slope tune" control just doesn't hack it as a replacement for passband tuning or IF shift. You can live with it, but it's a step backwards.

2. The 12 (or is it 13) pin DIN jacks on the back for various accessory interfacing. Wiring cables to the plugs for these jacks is a real exercise in dexterity and visual acuity.

3. The noise blankers are just about useless. There's a mod to improve this situation, but haven't tried it.

4. The RIT knob is too small, not smooth enough, and too fast, and does not have an "off" detent.

Most of these things are nits.

The company is Squires-Sanders, and the city of origin was Morristown, New Jersey, not Martinsville. It was first sold in 1963, at a price of $895. I owned one in 1968 - quite an interesting receiver. If you have one, you are probably already aware of how hard it is to find the 7360 mixer these days.

I have owned an 850SAT and operate SSB/AM/CW and digital modes. Always great reports. There is an attenuator of some sort for BC band, There is a mod to remove it, but if you do and live near a powerful BC station you may have problems. I am not a BC band dx listener so never cared to change the KW design.

1372. Re: Intermod and the Kenwood TM-D700A

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-27 22:36:25 UTC
From: carl <cll@ix.netcom.com>
Message-ID: <94vic2$m7s$1@slb6.atl.mindspring.net>
Source record: 65397

I have a TM-D700A, use it in Seattle which has a lot of RF, and do not have any significant problems. However, it is a ham radio, not a commercial radio, and has wide RX, so it will be somewhat more susceptible than a commercial radio.

Overall, I like this radio very much, and would recommend it.

Carl.

From: Ron <NoSpam@nospam.com>
Message-ID: <eqIc6.28$1t5.1841@typhoon.sonic.net>
Source record: 65298

I'm getting severe phase noise on both transmit and receive on my TS-870 on all frequencies above 21489.99. It's probably in the PLL board...the hardest one to get to in the radio. Anyone had this problem, or any experience with Kenwood's factory service? Does anyone have a phone number to call for the factory service center in California?

Ron

I made 5-6 equal TVI filters with two sets of tuned quarterwave lines
using up to 1cm pvc coated wires to adjust the end capacitance.
Notchdepth is 85dB on 144MHz, but they covered most of band III with
minimum attenuation. So I see no reason for this shouldn't work on 6m,
airspaced trimmers may be a good choice, but your suggestion using
needles to short is usually overlooked by amateurs

The note is published in Radcom April 1982 pp320, Technical topics,
"Double stub 144MHz TVI-notchfilter" - it is also found in Technical
topics scrapbook. see

Of course, that 7360 was one of the things that made that receiver stand out. There was an often referenced article in QDT in 1963, by the designer, I think it was Squires, that made a big deal about that tube as a receiver mixer. I've never seen the article, but have always assumed it in some ways discussed the SS1R.

Certainly for the next decade or so, the 7360 became The Tube to use in receiver mixers. You'd see it in complicated receivers, and simple receivers. ONe of those simple receivers used a Q-Mulitplier at the frontend, to improve selectivity without adding an RF amplifier, and that scheme bounced around for the rest of the decade in the form of receivers and converters.

But I was recently looking at a block diagram of the receiver, I can't remember where, and it wasn't all that unique. If I'm remembering properly, the design was basically a crystal controlled converter feeding a tuneable receiver, just like the Collins receivers and a lot of others at the time. So it had a first mixer tube good at being resistant to overload, but some of it's effect must have been lost by not dropping directly to a narrow filter.

It seems like one of those pieces of equipment that many lusted after, and which did make innovations, but which didn't sell all that much. It was available for a relatively short time. There was also supposed to be version for shortwave listening (ie different frequency coverage) and that seems rarer than the ham one.

Oddly, this is the third reference in a month to the receiver. Someone asked a technical detail, wondering about the bandwidth of the filter, and then somewhere else someone asked about getting a schematic.

You've just turned the thread back to where it started.

The problem seems to be that people feel they have sent money off
to get a service, rather than to fund experimentation. When they don't
get what they've paid for, they feel they are owed something.

AO-40 has immense value, just by being in orbit. If it doesn't
function to the full extent of it's design, it still has tremendous
value. As I said when I changed the subject of this thread about
a month ago, the only way to guarantee no failure is to not
start in the first place.

I saw Buzz Aldrin in an interview on TV last year, and he said
something about how society doesnt' want to take risks. He knew
it was risky to try going to the moon, but it was a risk he was willing
to take. When you stop taking risks, you stagnate. Once something
becomes commonplace, there is tremendous inertia to overcome in order
to change things, because everyone has invested in the old. Isn't that
what happened when spark transmitters were dropped, and when SSB
came into ham radio, and packet is mostly 1200 Baud because it
became a "utility" rather than an experiment?

So let's not go to expensive and innovative satellites, because
AMSAT risks "wasting" a lot of money, and stick to bands where
people have equipment and money tied up, because those consumers
see the satellites as a service rather than an ongoing attempt to
push what can be done by amateurs.

I earlier mentioned that in December it will be forty years since
the first ham satellite was launched; from this vantage point
we've basically been in sapce since the beginning. But December 2001 will

also mark the 80th anniversary of the Transatlantic Tests, where hams showed that thoes "useless" frequencies below 200Meters could be used for distant communication. And coincidentally it marks the 100th anniverary of when Marconi sent a wireless telegraph message across the Atlantic, which lead to hobbyists playing around with this new radio stuff, and ham radio was born.

If people weren't taking risks, all of these high tech gadgest that people want reliable service from would not exist.

Let us assume that the interference is really being caused by your very strong 50MHz signal getting into the antenna amplifier via the input connection (I'm sure that this will be the main cause, but it may not be the only problem). However, what you essentially want is lots of attenuation 50 - 52MHz, and as little as possible elsewhere. However....

Using coaxial stubs CAN be very effective, but there are several serious problems with simply adding a simple o/c quarterwave or s/c halfwave stub across the input of the wideband amplifier. These include:
1. The width of the notch will be so wide (even with the lowest-loss coax you can find) that you will also kill the TV low-band (Ch2 - 55.25MHz - will, of course be the worst affected).
2. As well as having a notch on 50MHz, here will be notches at odd multiples of 50MHz (if quarterwave) and all multiples (if halfwave). This may make a bit of a mess of several other TV channels.

The obvious solution to the width problem is to make the notch narrower. With stubs, you can do this by cascading similar stubs, each separated by a quarterwave of coax. This will also greatly increase the depth of the notch. A single stub will give you a notch of 25 to 30dB, and two stubs will increase this to nearly 60dB (I doubt if you'll need anything like this). However, this will not change the 'harmonic suck' effect (although these sucks will also be narrower).

You cannot eliminate the multiple harmonic sucks, but you can move them around so that they do not fall on those frequencies which you want to receive. You can do this (for example) by adding capacitors or inductors in the appropriate places (I won't go into this here).

You will probably be better off with a circuit using only capacitors and inductors. However, there will need to be more to it than the simple equivalent of a single coax stub. I have a typical circuit in mind, but you would have to calculate the values or do some 'jiggling' to values obtained by means of 'inspired guesswork'!

Having said all this, I'm sure that you are not the only one having trouble with 6m hitting TV (antenna amplifier or not). I wouldn't be surprised if there are several off-the-shelf filters which are purpose-made, and don't cost too much. If not, let me know - I'll move to the USA and set up in business!

73,
Ian.

1395. Sale! 100Watt to 1400watt HF80-15M Amplifiers

Hello, I have alot of 80-15 meter amplifiers for sale, after the closing of a retail outlet, below is a price list:

Mobile Units: (these units require about 30 watts drive, have selectable power output, and have a 25DB receive pre-amplifier)

KLV 100 watt unit: $89.99
KLV 300 watt unit: $175.00
KLV 300 watt unit with thermal protection: $ 225.00

The units below all have thermal protection, and SWR protection:

KLV 600 watt: $399.99
KLV 800 watt: $435.99
KLV 1200 watt: $799.99

Base Models: (all base units 110 volts)

Tube Type: (these units use the 811-A, or EL-519)

KLV 200 watt: $234.99
KLV 400 watt: $434.99
KLV 1200 watt:$699.99

Solid State:

KLV 300 watt: $599.99
KLV 500 watt: $699.99

My name is Justin, and I can be contacted at (909) 279-4193,
or at: justindepolis1@aol.com
Quantity pricing available, and prices can be negotiable, thanks, and 73's.

You are correct..violence is not the answer. My only wish is that The Customer and Mosley would site down for a cup of coffee etc and hash this thing out. The only mistake that the Customer made was not to take the refund that was offered once to him. I bet if the offer were made a second time he would take it and post the results to the newgroup. Then I would be more comfortable with purchasing a product from Mosley. Until then I have to take the Customers point of view.

I have a suggestion. How about a ARBITRATOR (non partial) and will try to resolve the issue. Sort of like "The people's Court". Both sides agree to let a non partial arbitrator listen to both sides and then come up with a decision. This is a lot cheaper than sueing eachother.

Based on those two issues you should buy the rig without question. I had one for 6 years.Terrific rig. Check the product reviews at aArrl.net and eham.net
I hated the broadcast band attenuator but not enough to open the rig to take it out. I like to BCB DX at night.

My main complaint was that the antenna tuner WAS NOT in the receive chain. Your antennas are near resonant? Dont sweat that one. If you are using a 75 mtr antenna on 160, it might be an issue. It can affect your receive strength. Otherwise that rig had the fastest antenna tuner I have owned, and would tune practically anything in the air.
Listen to Newkirk.....he knows his stuff.

Dave -

Traditionally, 6m has been the best way to get the "Worked all channel 2's" award. Various low and high pass filters, even (maybe especially) those that are effective on HF tend to be ineffective on 6m. The main problem is that 6m sits right in the middle of what would've been TV channel 1. TV sets tend to have RF front ends that are very poor in terms of strong adjacent channel signal performance. Also, TV's are usually poorly shielded (how many 15KHz harmonics can you count?) so 6m will be picked up by the power wiring and the TV circuitry itself!

What to do? I can't say what if anything will work for you, but here are a few things to try. I'm assuming that your 6m rig is clean, so my suggestions all apply to the TV system. 6m harmonics should not be much of an issue even if present because they impact only one VHF TV channel (11 I think). The basic goal here is to reduce the 6m signal strength at the TV's, TV amp and TV antenna.

1. Move your 6m dipole as far from the TV antenna as possible. The dipole is physically small (10' or so long), so this ought to be easy to do.

2. Keep the 6m and TV ant cables as far apart as possible. You say that you get an SWR of 1.3:1 WITH a tuner? Better to adjust the 6m dipole so that you have a low SWR *WITHOUT* the tuner, assuming that you're feeding the dipole with coax. If this turns out to be the problem, a "current choke" balun at the dipole may also help. If you're feeding the dipole with twinlead, you need to be more careful about what is near the twinlead's path from the antenna to your radio. In either case, the idea is to prevent the 6m antenna feedline from radiating.

3. Orient the 6m dipole so that the TV antenna is directly off the end of the dipole. Putting the TV antenna in an antenna null is the simplest way to reduce the 6m signal level at the TV antenna.

4. Choke/filter the AC power lines feeding the TV amplifier and the TVs. Radio Shack (and others) sell a ferrite core for this. I think they're fairly inexpensive - $3 for 3 or so...

5. Build quarterwave stubs tuned to 6m and install them at the antenna inputs to the TV amp and the TVs. This will selectively reduce the 6m signal level to the amp/TVs. It's possible that the only one you'll really need is on the TV amp - assuming that it's the only box being overloaded. If channel 11 is used in your area, the stub may also affect it. If so, the stub may not be a good idea. (BTW, the halfwave stub

suggested elsewhere would also affect the 2nd harmonic of 6m. Lucky for you, 100MHz is not a TV channel. Unlucky if you're using the same antenna for FM broadcast!)

Good luck. Enjoy 6m!

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur,rec.radio.amateur.equipment

I'm a 46 year old extra class ham (since 1992) looking for an elmer to help get me started in building. I'm located about 5 miles from ARRL HQ.

My interest (today) lies mainly in building QRP CW tranciever kits. I realize that today's kits have excellent instructions, detailed PC boards, and are easily assembled by anyone who knows which end of the iron is hot ... but I don't ... grin!

I'd like to build a Oak Hills Research Norcal 40A for 30 meters, as well as their watt meter and digital freq display. Pretty ambitious for a guy with NO building experience (outside of dipole antennas, and connectors ... g!).

I could use a lesson or two in soldering techiniques (no surface mount stuff, yet), desoldering (now THAT might come in handy ... grin!), winding toroids, equipping a workbench (tools and instruments), and the like. Just enough to get me going, I'll take it from there. If I pick up some theory along the way, all the better, but building a kit doesn't require you know how it works (!).

I'd be more than happy to travel to your QTH if getting around is a problem. I'd pay for any phone calls. Hell, I'd even buy ya lunch! Anyone got a Saturday or Sunday (or two) free?

Thanks,

Dennis KD1JT

1411. opinions on some radios for a soon to be new ham

Hi all, I am in the process of getting my license, I will probably start out with tech plus but plan to go as far as I can. So here is my question, I'd like to have one rig for my base that can do all modes rather than have a million radios mounted in my room.

So question #1, I am looking at the Icom IC-706MKIIG and the Yaesu FT-847, does anyone have any comments on either of these 2 radios?

And question #2 can anyone recommend any other all band radios for base operations?

I'll be the first to admin this is a new area for me, I have friends and relatives that are hams and I'm tired of the garbage and disrespect on 11 meters, I've been watning to do this for a long time and now I have decided I have put it off too long.

DJ-580 has problems. On VHF it receives but doesn't transmit. On UHF it transmits but doesn't receive.

Its a radio that was for sale as-is on Ebay, but it seems that a problem like this would be in some of the settings, could it be fixed with a processor reset? It might be set in the cross band repeater mode or something.

any help would be appreciated.

One thing I always do, if I'm buying anything, is to write down the Email address of the seller. If I were selling, I'd periodically get the names of the bidders.

That way, if Ebay pulls some funny s**t, like, in this instance, some clerk confusing a 2M rig with a bootlegger's CB, you can at least get back to the bidders or sellers and explain that someone there didn't know what he was doing, and you can then complete the sale.

Unfortunately, EBay doesn't get their piece of the action in this case.

These virus things are always around, we clean up the whole network each night and the next day someone else reinfects due to using an older file on a floppy or someone else software.

Remember that there is not always a fix for the most current one so it just gets moved to the hold file for later eradication.

When you do business on the www you are exposed to these nasty virus.

I do stress that this is not the proper forum for virus alerts, I can tell you that it is not efficient use of the bandwidth.

There are specific groups for the alerts.

lets keep this on topic, end of thread.

...and totally illegal! I have forwarded the URL to the FCC's Enforcement bureau. Their junk will be even cheaper after they get busted.

BTW, you can file a complaint against these clowns by sending a short e-mail to fccham@fcc.gov . If they hear from enough of us, they'll do something about the problem!

And the gear is really CB JUNQUE that's ILLEGAL TO SELL in the first place.

Justin had some negative comments about him posted on one of the newsgroups
and I've not seen anythng about the problems being resolved.

If we're all lucky the FCC will step in and put these idiots out of business.

These things are like drugs, if we want to shut down the sellers we need to attack the manufacturers first. HY Electronics has their place in the CB world and would have a better place if they would require proof of a ham ticket before selling these 'export' radios and amplifiers.
The KLV amps look like CB junk but HY does sell some good clean amps (palomar, texas star, boomer) that are good if you need a little extra without having to spend thousands like you would on an Icom amp.

The filters in the Icom are FAR superior to those in the FT-847. I have friends who have both, and I'd prefer the '706. Yaesu went with CERAMIC filters instead of QUARTZ and relied on the DSP to make up the difference. BAD DECISION! Consequently, the filter skirts, their sharpness, is highly compromised over real quartz filters. Even with the DSP, the AGC pumps due to what would be our-of-passband signals on the 706 with its better filters.

1432. Screwdriver antenna for apartment

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-28 23:02:38 UTC
From: jason_hsu@my-deja.com
Message-ID: <9528eagcs1@nnrp1.deja.com>
Source record: 65407
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.misc

Some of the questions I have include:
1. Can I use one if I only have 8 feet of clearance on the small patio (8 feet wide, 8 feet tall, 6 feet wide) outside my sliding door? Is it possible to mount the antenna at a slant? I want to hear about any creative solutions from you.
2. What type of mount/tripod would be appropriate? (I don't have a railing.)
3. How quickly can I assemble and disassemble the antenna? (For stealth and security reasons, I need to remove the antenna when I am not operating.)
4. Which versions (original DK-3, ElectraSlide, etc.) of the Screwdriver are most appropriate for me? What advantages do the more expensive versions have over the original? Can some versions (like the D&K KH-600 HF MOBILE ANTENNA) really operate on 160m?

SOME BACKGROUND:
I am seriously considering a Screwdriver antenna for operating HF from my ground floor apartment (no big trees or bushes close enough to conceal wires and keep them out of the way of people or dogs passing by). A mobile antenna would be less cumbersome to work with than a big wire antenna. The Screwdriver seems to be the best antenna for me.

I have had modest success with Hamsticks I am borrowing, but I know that Screwdrivers are more efficient. Also, Screwdrivers are multi-band and are easier to tune (due to the automatic tuning aspect). Has anyone used a Screwdriver antenna for non-mobile operation?

I was considering a Texas Bugcatcher, but I am not sure about the quality of the version from Texas Radio Products, and the version from GLA Systems is too expensive. Screwdriver antennas are almost as efficient, and several versions sell for near or below $200.

1435. FS: Yaesu FT-847 - Like New out of the box...purchased 9/2000

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-28 23:43:01 UTC
From: jhulet@aol.com
Message-ID: <20010128184301.29899.00001819@ng-fs1.aol.com>
Source record: 65411

Hello,

I have a "like new" Yaesu FT-847 Transceiver for sale. I am the original owner and I purchased the radio new from AES in Wisconsin in the middle of September 2000(have receipt). The radio works perfectly in every way, not a smudge or scratch on it. The box was opened very carefully when gotten and then stored in a closet since September, its like new. The operating manual is still stiff as a board, seeing very little handling as I found the rig to be very user-friendly.

Why am I letting this great rig go? I have again fallen into this desire to play around with some new toys... So against my better judgement, I am putting my beloved FT-847 up for sale. Its been a back and forth decision. Its a wonderful rig and I would bet, I will be back to get another after this fettish passes. This is the first rig I have owned that I felt the DSP really added something. Once set to my liking, I can push the Digital DSP button "off" and then back "on" and boy it really does pull out the other operators voice...and lower the band noise. With all the things the FT-847 does well, I would say if I had to only pick one attribute, it would have to be its DSP... Its great! This rig has never hand the top off, its untouched inside and unmodified in any way...

Perfect, Like New, Yaesu FT-847 w/ Handmic, Manual & Box(e-mail me for some pictures!)

$1,100.00 Shipped

Source record: 65417

Go here and do the mod in reverse
http://www.qrz.com/download/mods-e-h/ft840.txt Real simple.

As for the TX problems, I suspect a bad trace on a circuit board. I had that happen to mine (840) for just the twenty meter band, luckily it was still under warranty.

1442. Narda Attenuators Symmetry?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-29 01:49:01 UTC
From: John Buck <kh7t@arrl.net>
Message-ID: <3A74CC08.48944C76@arrl.net>
Source record: 65418

I have been told that the Narda power attenuators
Part numbers 769020 and 776-10 are not symmetrical in power capability.

That is the rated 20 watts is ok on one end but can burn out an element
if applied to the other end.

Is this true? If so which end is the high power end?

John KH7T

Hi all of you satellite fans,
well ao40 doesnot work has expected BUt it is was ham radio is all about?
i have read many commentary about it ,some says to scrap it,it was a waist
of money ...
when you are putting some money in your car tank and polluting the
environnemnt dont you care???

ham radio is experimentation at first,read why you enter this Hobby,
if i have the ressource of Amsat i would try many other things about ham
communications.

Look at the cellular communication industries that are putting satellite in
orbit and it will not be possible to stay there in orbit because of
market!!!!!!!!

think about it and you will see that ao40 is what ham radio is all about
experimention and reaching the earth

jason,
1. Yes, probably, to both questions. Just have to try it
and see.
2. Your imagination is your only limit. How about a large
flower pot, fill it with concrete with a pipe standing up
in the center of it. Mount the screwdriver on a pipe that
would fit into the one in the pot. Paint the concrete
green and leave it on the patio. (tell them your plant died)
3. Beats me, just depends on how much you practice (LOL).
4. I think 'which' antenna you choose would be more a matter
of how much you want to pay for it. The 'High-Searas'(s) are
nice, but I don't think they're worth the cost. Up to you...
4A. 160 meter operation is going to depend on the length of the
'whip' you use, and if you use a capacitive hat. It's
certainly possible.

'Doc

FOR SALE:

Henry 3000D high power 13Mhz commercial linear amplifier.

GREAT! for the QRO operator who wants to run 1500 watts on continuous duty cycle modes RTTY, SSTV etc. It can be modified to run single band or multi-band operations.

With the following:

Complete cabinet with blower.
Bird 5KW inline Bi-Directional coupler with slugs.
Control Pane. Controls startup and monitors operation. Reflected Power, Incident Power, Plate Current and Multi-Meter for PA (grid, volt and fillament) measurements.
Eimac 3CX3000A7 Triode rebuilt and guaranteed.
Filament Transformer
HV Rectifier blocks for the Anode Supply
Operations and Maintenance Manual

If your a builder who likes high power, then this linear is just right for you.

In addition, I have Mil-standard gold plated motor drived inside contact roller coil for very high power and a 15KV 50-1200pf motor driven Vacuum Variable Cap.

Contact me via email for price, telephone number and detailed discussions.

Location Sacramento, CA

>you noticed this to be a problem?

With RF speech processor and High-Boost, TS-850S has one of the most efficient (punching) signals of any other rig. I get much better reports on TS-850S than on IC-735 or FT-100, despite the same peak power. Somewhat lower IMD, which QST has found, is practically unnoticeable. Ignacy, NO9E no9e@arrl.net

Source record: 65444

I've got the 706IIG for car and backpack and the 775DSP for a base, and I'm quite pleased with both.

If I had neither today, I'd think seriously about the Kenwood TS-2000 as something in a price range between the other two. And it can go mobile very nicely with the remote-head option.

I think we need to differentiate between "risks" here. There are two kinds of risks associated with these satellite launches. First is the launch itself. Second, is the functionality of the satellite. I believe that all hams accept the risk of the launch as just a part of doing business. We've all watched as many high-profile launches have failed spectacularly with hundred million dollar commercial payloads aboard.

BUT, I believe that hams (especially AMSAT members and contributors to the program) feel that if the launch itself is successful, there is a strong expectation of a useful, usable payload in return for the investment.

In AO40, we had an entirely successful launch, but we've had a number of on-board failures with the satellite itself. That is very disturbing. To AMSAT's credit, they are holding a board of inquiry. But, I think we all should be asking ourselves if we, as hams, should be spending the contributors hard earned money on highly complex satellites, using risky technology, with limited odds of being operational when launched.

Admitedly, the jury has not come back in on AO40 yet, and I am in no way disparaging the efforts of the many fine people who worked to build this satellite. (I sincerely hope we can recover use of the bird, if only for mode L/S) I am only questioning a philosophy. If we should "lose" use of AO40 for all intents and purposes, I believe that the inquiry board should further explore whether future AMSAT projects, funded with member contributions, should maximize the chances for a usable satellite in orbit, or continue to pursue complex, risky technology for it's own sake.

Good points!!!!

Something to consider also.....

With a space shuttle repairing sats all the time....Would it be
possible to talk NASA into doing a repair job? Or maybe just capturing
it and bringing it back down for repair/relaunch.......

I think that would be something to consider....

The Feb. 2001 CQ Magazine has a "preview" review of the TS-2000 that
runs for several pages, and it's fairly favorable.

I think not. The shuttle would have to match the orbit of the satellite.
Last I heard AO-40 had a maximum altitude of like 50000 kilometers.
The shuttle can only get up to maybe 800 kilometers (bad guess from
memory).

I assume you know it uses a separate power supply/Speaker !
A Yeasu FT-200 as a Tempo One transceiver .
They came in Black and White

If you have no real plans to work sat's, the 706 would be fine. The only thing that the 847 will do that the 706 won't is full duplex for sat work. I haven't tried an 847 to check the receiver on HF, but I hear it is prone to blowby if you don't use the extra filters. If the band is not busy, you might not notice this. If it is, you might. I just got a new 706mk2g about a week or so ago, and have run it though the mill. Overall, for the size, it's a pretty good radio. I'm satisfied with the HF receiver. It's no 775, but good enough for gov use. The 2m, 70 cm pretty good. The 6m ok I guess, except in this area I get alot of BC crud due to being close to the ch2 tv tower and fm stations etc. The "AM" use for AM-BC and SWL is great!. Real nice sound with the 8 kc AM filter. I'm not going to knock the 847 much as I haven't tried one, and it is a good looking rig, but I can say for the money "appx 900$" or nearly 300-400 $ cheaper than the 847 , you can't go wrong with the 706mk2g. I've been having a blast playing with mine. I bought mine mainly for mobile, but have been using it in the house also as it's so handy. I've compared the audio with my TS-830 kenwood, and the 706 stands up real good in that dept. Both transmit and receive. With an external speaker it sounds like a "big" radio, not the cb sized thing it is. The only thing I really couls use is a cw filter, which I plan to get the 350 hz version. Either rig, I'm sure you will have fun. MK

1480. FS: Ten-Tec HF station

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-29 18:41:16 UTC
From: k5dh@raytheon.com
Message-ID: <gPid6.63$3d3.1432@dfw-service2.ext.raytheon.com>
Source record: 65206
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For sale:

Ten-Tec 560 Corsair HF transceiver, equipped with optional
8-pole first i-f filter, 1.8 KHz SSB filter, 500 Hz CW filter,
and 250 Hz CW filter; model 263 remote VFO; original manuals
for xcvr and VFO; nice (but not Ten-Tec) electret desk mic;
homebuilt power supply relay which allows use with non-TT
power supplies. Clean and working, with no damage, repairs,
or modifications that I am aware of. Cabinet top has a few
blemishes from having other pieces of gear sitting on top.
There are a couple of small scratches on the front panel in
unobtrusive places. VFO cabinet has two deep scratches in
its left side, but they're not seen when the rig is set up
in the operating position. It really is a good looking and
good working station. This has been my main station rig for
several years, and I'm only selling it because I've bought a
newer rig. I'll be happy to set up a sked so you can hear it
on the air. I am asking $750.00 plus shipping (two separate
packages). I will ship world-wide, if the buyer wants to
spend that much money on shipping.

Here's a (not very good) photograph of the equipment set up
in my station:
http://www.qsl.net/k5dh/corsair.jpg

>sake.

The answer, obviously, is "yes". It is appropriate and desirable to do
both... although perhaps on separate satellites.

The problem here is in the expectations, not the hardware. Superficially,
it looks like this failure was a close counterpart of a launch failure:
the problem was in perfectly ordinary satellite hardware which was needed
to reach the final orbit, hardware based on stuff that worked fine on
previous spacecraft, not in something complex and risky and experimental.
An occasional failure of this sort is inevitable, and has to be taken
philosophically, like launch failures. Trouble is, AO-40 took so much
time and effort and money that there's only one of it, so everyone was
really depending on it working.

Future AMSAT projects, funded with member contributions, should sometimes
maximize the chances for a usable satellite in orbit, and sometimes pursue
complex, risky technology for its own sake, and sometimes even a cautious
mixture... but definitely should avoid major programs, leaning in either
direction, whose success or failure rides on a single satellite. (And I
doubt very much that either the inquiry board or AMSAT needs to be told
that!)

AO-40's orbit is far too high for the shuttle to reach it.

I don't think a $100M shuttle launch can be justified to repair a $4M
amateur satellite. Even if the orbits were compatible, which in the
case of AO40, they are not.

I have this neat little swr/power meter......it appears sturdy and very well made.

Made by Quement, model number is SWB-3.

It appears to function.....yet for the life of me, I cannot figure out how to use it.

Is there anyone out there who has this exact device, that can tell me how to use it?

No previous hamsats utilized either a large 400N engine, nor an arcjet
engine, or carried such a large amount of propellants.

> An occasional failure of this sort is inevitable, and has to be taken

Occasional doesn't cut it when you make a one of a kind, expensive sat
such as this, that took 10 years to devleop, build, and launch.

> philosophically, like launch failures. Trouble is, AO-40 took so much
> time and effort and money that there's only one of it, so everyone was

How far away are the repeaters you are trying to hit? That would
determine whether you buy a tiny unit that puts out milliwatts of
power, versus one that puts out, say, 5 watts of power.

You might start by getting a copy of the ARRL's Repeater Directory
that would list the repeaters in your area/town.

Um, have you overlooked AO-10 and AO-13? Both had such engines; indeed,
as I understand it, the AO-40 bipropellant engine was basically an updated
version of the AO-13 one.

>nor an arcjet engine

The arcjet, admittedly novel, doesn't *seem* to have been involved in the
AO-40 mess. (Indeed, it may help save the situation, as much as it can
be saved.)

>> An occasional failure of this sort is inevitable, and has to be taken
>
>Occasional doesn't cut it when you make a one of a kind, expensive sat
>such as this, that took 10 years to devleop, build, and launch.

Quite so. My point is that you *must* be able to deal with failures,
because they *will* happen. Repeat, they *will* happen. Trying to avoid
all failures is the mistake NASA historically makes, and not only does it
drive up costs tremendously, it *doesn't work* -- failures still happen.
(Indeed, it is not clear that NASA's tremendous expenditures on failure
prevention actually buy them any improvement in reliability at all,
compared to -- say -- the hamsats.)

The crucial mistake here is the "one of a kind... 10 years to devleop,
build, and launch" part, not the "new technology" part. A conservative,
cautious, no-unproven-technology AO-40 design quite possibly would have
failed exactly the same way. The problem is not new technology, but
betting the farm on one bird, no matter how it is designed.

Identical 400N engines were on Oscar 10 and 13!

In fact, the engine has become relatively smaller on this satellite.

Cleaning out the 'shack to buy some different gear. Have the following scanners/radios available for sale. (ALL are in absolute MINT/AS-NEW condition both PHYSICALLY and ELECTRONICALLY unless otherwise noted, with supplied accessories as noted for each one)..:
1.) PRO-2052 trunktracker.Does Motorola and EDACs.1000 channels.Lots of features.Retails for $369 In 'Shack catalog.Includes everything EXCEPT box. MINT.Low use (less than 4 hours total!)..... $250 (specs in current RadShack catalog)

2.) Bearcat BC-9000XLT "alphanumeric" scanner.500 channels.25-550 and 760-1300 Mhz (minus cell:('virtual conversion' can be done..will provide info IF requested...).Auto-store and MANY other features.Less than 15 hours use.Mint/ AS-NEW. With box and all accessories.Retails $349-$369 new!.....$255

3.) Sony ICF-SC1PC handheld scanner.NEW IN BOX! (Only removed to test for proper operation.)25-1300 Mhz (less cell, restorable)."Service search" features:selectable modes and step sizes.(no SSB).Includes all factory accessories & software disc.NEVER USED!.....$180

4.) Regency MX-5500 desktop scanner.25-550 Mhz continuous.20 channels.Selectable modes and steps.Superb sensitivity on milair band.One VERY light, nearly invisible mark on outer case side.Otherwise, in excellent to mint condition.Works superbly. Speed mod professionally done as is noise mod. A very nice radio for those not needing 800 Mhz.Includes power supply and antenna (no box or manual).....$85

5.) AOR AR-2515 desktop/mobile scanner.2000 channels.25-550 and 760-1300 Mhz (full coverage w/ cell).Very fast scan/search rate.Resembles the AR-2002 and 3000 in appearance.Selectable modes and steps.Perfect/MINT condition with box and all accessories.Light use (probably 18 hours total)Sold new for nearly $800.....$480

6.) Regency MX-7000 desktop/mobile scanner.25-550 and 760-1300 Mhz (including cell).Same features as MX-5000(above..) plus 800 Mhz.MINT with box and all accessories.Sold new for $399. Easy use(less than 22 hours total).Speed mod and noise mods professionally done. Excellent sensitivity and selectivity on all bands.....$185

Again, ALL radios are MINT/ AS-NEW unless otherwise noted.Please..NO trades or 'offers'.These are all my "personal" units and not just junkers for 'resale', so I KNOW they are as stated.Payment by MONEY ORDER ONLY! (Will accept personal check IF you dont mind 15 day waiting period for clearance.)<:
Kindly include $12 shipping EACH (except $ 7 for Sony)for FULLY-INSURED,WELL-wrapped, PRIORITY MAIL shipment.Radios will be sent SAME or VERY next day I receive your M.O. (again..checks WILL be held until clearing bank...sorry!)Email me directly with any questions.If multiple radios are

purchased at the same time, can give slight break on shipping charges.
THANK YOU and Happy Scanning ! Larry W. (Klarrg@aol.com)

Source record: 65226

I've got the IC-T81A and it is ok, but not great. I got it because it is so small. The 6M performance is poor and (of course) only AM or FM - not SSB. There is so little 1.2G in my area that I have never used that band at all. I have the Kenwood TH-D7A(G) and it is really nice, although only 2/440 - but being full the dual-band,and having APRS and TNC make it a real workhorse. The battery makes it a bit too large for slipping in a pocket.

I am wanting to sell my Kenwood TM-241 2mtr mobile radio. This rado works fine with one glitch. The LCD display likes to go crazy. Some times it gets scrambled, and some times it goes blank. If you turn of the radio, press on the display, then turn it back on, it usually corrects it self. This is my personal radio.

Selling as is for $50.00 O.B.O. plus shipping to ContUSA.

Hello, I am looking for a good mobile 2m/70cm radio. I ahve found the Icom 207H. Does anyone have any comments on this radio. I have checked several brands at different places and so far this seems to have the best bang for the buck. TexasTowers.com has this for 289. so far I have not found any one that can beat this price.

can any one comment on the radio and/or texas towers?
also would anyone like to comment on a different radio. Primarly i am looking for a good mobile radio for 2m / 70cm. Would prefer that it be computer programable but it does not have to be. Have not really done much in the line of digital work yet except for psk31 on 20m.

Does not need to be new. if anyone has a used radio in good shape please let me know.

Thanks

Roland,

I have a TA-33JR with the WARC dipole just like new all the parts all
the books (2 copies) totally disassembled ready to ship. Worked
perfectly on field day heck I ever relabeled the parts with the proper

part numbers using a label maker and water proof labels.

The only fly in the ointment is my Momma didn't raise any kids
stupid enough to get involved in one of your scams.

What yourself dealing with this guy, check Deja.com.

I don't know why NASA is always mentioned in comparisons with amateur
satellite reliability. NASA doesn't build that many satellites, do they?
And they certainly don't launch many...

Looking at launch manifests it seems like the vast majority of satellite
launches are by commercial builders, operators and launchers. NASA usually
isn't involved, or so it seems.

: usually talk. MK
: --
: http://web.wt.net/~nm5k

I have 2 of those AEA rigs...I've talked to Germany from NY, standing in
the street(only using one of them, of course).
BTW, these radios are only 2 watts(and BTW, they do CW also).
The antenna was not a "duck", but a base-loaded whip.
I'm sure a duck would work worse, but still, when 10 is "open", you should
be able to work the world with 4 watts SSB and a duck.

1520. Racal RA 1792 - LCD question

Build your own. If I can do it anyone can. Look up WM2U or go to
www.packetradio.com(K4ABT's site). You can order the interface from there in
kit form or built or he has radio secific plans for his kits there and you can
build the optoisolator interfaces from his plans. I have used and builty both
the opto and the 2N2222 interfaces and both work FB on every rig I have put
them on. Keep in mind that the cords MUST BE AS SHORT AS POSSIBLE. you will
get Ground loops in the cables if they are not.

From: Tony Reutter <treutter@kih.net>
Message-ID: <3A76D6BC.30003@kih.net>
Source record: 65255

I have a dx60B that has tx probs and I have found a dx60
schematic/manual on BAMA but one tube isnt on that shematic
It appears to be a 6GU8A, not a 6CU8A..the markings are very worn..when
I checked in my old tube checker thinking it
was a 6CU8 it blew the bias fuse..anyway, I can't find anything online
abt the difference between these two rigs and also
can't find anything about the 6GU8..I did find a chart for a 6GV8 in a
1977 handbook but just a base type..I would love
to get this little rig running but need a schematic/advice!
Thanks to the ham community in advance
Tony

1531. Beware of defective RG-213 from Radio Works

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-30 18:12:22 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <auDd6.213$QI5.18117@newsread2.prod.itd.earthlink.net>
Source record: 65257
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Just wanted to warn everyone about some bad coax being distributed by Radio Works. The cable in question is their "RG-213 Plus", and according to their catalog "features an improved braid and even better quality, non-contaminating jacket". When I notified them of the defects in the original cable shipment, they promptly shipped out a replacement length and issued a UPS pickup for the original cable. After foolishly installing connectors on the new cable, I inspected a few feet of it and found it to possess the same defects as the first batch. If you've purchased any of this stuff recently, I suggest you look it over carefully before using it. The info printed on the cable jacket is: "IEWL 4062 213/u Type"

Here's what I found in my cable:

1. While paying out the cable, I encountered a roughness in the outer jacket that felt as if the cable had been scraped. A closer inspection revealed a poorly closed seam running the length of the cable, where the jacket ends had been fused together. The rough spots, in places, were actually small rough holes. One of the holes was large enough I could actually see the copper braid.

2. In a couple of places, there was a "lump" in the cable, up to an inch or so in length. I've opened up such cable sections in the past to find that the braid had been folded back over itself at that point. Usually, braid damage accompanies such a defect (torn strands, etc.).

In addition, while soldering on the connectors I noted that one of the braid sections (multiple strands of wire) was considerably oxidized. Hard to believe that the manufacturer would go ahead and make cable with such material. The oxidized section was not present in the first cable shipment I received.

They get mentioned because they're the prominent example -- at least, in
the unclassified world -- of how to spend almost unlimited amounts of
money in (futile) hopes of improving reliability.

As for numbers, they typically build and launch (often via contractors,
but that usually involves heavy NASA intervention) several spacecraft a
year. They're no longer such an overwhelming force in the market as they
used to be, but they're still one of the larger players.

1535. Re: Amateur Radio Grounding ....

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-30 19:55:31 UTC
From: Roland S Geter Sr <roland@geter.org>
Message-ID: <3A772C23.F113BBF3@geter.org>
Source record: 65260
Cross-posted to: rec.radio.amateur.equipment,rec.outdoor.rv-travel,alt.rv

I meant that each radial would be 1/4 wave of the band used although all running in the same direction toward the front of the RV. ----- they would be resonant and maybe fan out a little. I think that I'm finally understanding that all verticals require this "ground plane" effect even if only with radials since they are really only half a dipole, right? It's the RF problem I'm not totally understanding. A radial-less R7 would be disallowed in any RV parks I've been to because it wouldn't be attached to the RV.

I like the drive on mast idea. Got any sketches or jpg's?

Where, may I ask sir, do you find a 2,3, or 4+ star RV park that allows you to hang dipoles in the trees? (hihihi) I've even had problems with my 21" elliptical DirecDUO ground mounted dish because all dishes must be >18". I get away with my 5BTV only because there are a lot of flag poles in this particular RV park so I hung one on mine proclaiming it a flag pole (traps and all). (hihi) Boy, when that 5BTV works it gives much better reports than any mobile mounted screwdriver I've ever had. Maybe that's why I'm insisting on trying to get it to work (stationary) mobile.

73's & Tnx agn,

1551. Kenwood TM-733A Lockups?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-01-31 04:47:17 UTC
From: Jeff N7QOB <n7qob@foxinternet.com>
Message-ID: <3a7799d8_1@news.foxinternet.com>
Source record: 65277

I have a Kenwood TM-733 mobile mounted in the truck with the remote head bracket and cable. Often times, the radio will lockup and quit responding to any control on the radio. The audio also gets muted and the display and s-meter lockup.

The problem for me usually happens while I'm driving, so I have not been able to troubleshoot it extremly well. From what I can tell, its either related to the volume controls (most likely) or the connectivity on the remote head bracket. It seems most likely that its the volume controls, as the lockups seem to happen after adjusting audio.

Has anyone else experienced this problem, or know of a cause and/or fix for this?

Any info would be greatly appreciated.

Thanks es 73

South Normanton & District Amateur Radio Club,
in Association with the G-QRP Club, will be holding
"Junction 28 QRP Convention" on Saturday 17th March 2001
at the Village Hall Community Centre, Market Street,
South Normanton, near Alfreton in Derbyshire.
Just 5 minutes from Junction 28 of the M1 motorway and the A38.
This will be a traditional radio event, organised in the true spirit of
amateur radio.
All under cover, there will be lots of traders with components, kits,
vintage and radio surplus, plus special interest groups and club stands.
Lectures throughout the day from Rev.George Dobbs G3RJV,
Rob Mannion G3XFD (PW editor), Tex Swann G1TEX (also from PW)
and Douglas Pitt of the N.B.T.V.A. (Not to be missed!)
Hot and cold food and drinks will be available, plus a licensed bar.
Talk-in will be provided by special event station GB0LOW on S22.
Doors open 10.00am. Admission is just ?1.00. Free prize draw.
Further details from the organiser on 01623 465443.
We look forward to seeing you there!

I'm kinda tired of being jerked around on this one; if you're interested, please check to see if you actually have the $, and verify with your significant other that it is ok to spend it. Finally, take a deep breath, count to 10, and make sure that it isn't an impulse buy that will cause you to disappear off the face of the planet after committing to. :^D

The radio is working perfectly on all bands and in all modes. The unit is a cosmetic 9 (the front panel is pristine, but there are a few light scratches on the case top and sides, and a little dust behind the display bezel). It includes:

-Owner's manual
-Copy of Service manual
-HM-36 hand mic

Offers?

Buyer prepays with a money order/cashier's check, or with Visa using PayPal, plus $20 for shipping (no exceptions, please; no CODs, no escrow, and no personal checks). Please don't inquire if these terms aren't acceptable. I can provide references until the cows come home, if need be...

I'm in the Chicagoland area.

Domestic U.S. buyers only!

Thanks!

Most radios can tolerate high SWR for short and sometimes long periods.
You can adjust the CB antenna for 10m by shortening the whip.

I have found CB antennas from Radio Shack to be mediocre performers on
10m. I have heard that Wilson 1000 (?) is better, but it is similar in
cost to 3-magnet mount + hamstick (<$60), which are excellent. That magnet
mount can be used later for other bands if desired.

Ignacy,

What about the wattage rating? Aren't CB antenna's designed to handle
only the low power usage that they are designed for? Could this cause
a problem even if I trim the antenna properly? I do plan on going with
the Hamstick as soon as I get the $$$, but in the interim, I was hoping
to use a Radio Shack CB antenna that I had been given to me for free.

Well if cb antennas are designed for 5 watts AM or 20 watts SSS pep,
then a 100-watt ham rig might overheat some of the internal wiring
connections -- then again, maybe not, given that there are so many
cb'ers who run illegal power -- I don't know whether the cb antenna
makers take that into account -- but if the connections look modestly
robust, and if any connecting wires look be 12-14-or-18 guage, there
shouldn't have much trouble handling whatever a ham rig would put out
on mobile.

Looking for a schematic that shows the p.a. and the alc and output
adjustments for an Icom IC-725. A scanned page or two would be nice.
Need to know what the bias diodes are that go across the final
transistors, and would like to know which pots set ALC and such...
Thanks for reading, and all help is appreciated...

IIRC, the K-40 is rated at 400 watts PEP. They boast about their power
ratings, not only for those who like to "pump up the jam" so to speak,
but also because a higher rating on a loaded coil tends to equate to
bigger coils and greater efficiency (the less RF converted to heat in
the coils, the more you can pump through it without converting the coil
to ash)

If you are working with the grey plastic coiled model, sort of like a cone shaped base, use as low of a power level as you can, these are very susceptible to shorts, and 25W or so is about all I'd run through one. They do make a steel whip with a thin black coil, about 60" or so, that goes for $18.95 and has std. 3/8 x 24 thread so a generic CB mag mount will work, and these work well. Valor makes a 10M magmount that is inexpensive, and Firestik makes the Mach 10, a tunable 48" 10M whip. Search the Web, especially some of the CB dealers, who have these available. I set upone of the RS stell whips with a 5" mag mount for about $30 total.

It probably doesn't really mater on an electronic keyer which way is
used as the pressure is the same on either side.

TEh old mechanical bug was made so the stronger thumb could hit the dits
and set the dits in motion. The weaker finger of the hand then did the
dashes. As most everything the general use was for right handed
people.

Have a Ten-Tec Pegasus 550, Remote Encoder 302 & Desk Mic 705 that I would
like to trade for a Kenwood TS-940S/AT or
TS-950SD + $$ -with Auto Tuner & CW filters in excellent to very
good condition.Unit must have manuals & original shipping
boxes.Pegasus & Accessories were purchased May of 2000, so still under warranty.
On the air less than 3 hrs (30 min
transmit total).All equipment in excellent condition & have
original manuals, shipping boxes & software.Great PC controled radio, but
I'm more of a hands on type of ham.The
only requirment I have for trade is that I have 2 to 3 days
to test Kenwood unit out fully before I ship Ten-Tec units.
If unit does not meet expectations, I would ship unit back
at my expense & reimbuse for original shipping charges.I know it sounds tough,But
have been had before & once bitten
twice shy.
Please email any questions to wd9ifw@qrz.com or radioman@rochelle.net.

Message-ID: <3A78BC22.AB917E3D@alltel.net>
Source record: 65161

I have been using a RS 12-996 (I think that's the #; the one with the
big external coil) magnetic mount antenna trimmed to 10m since April.
The results have been pleasing, although I have no other to compare it
to. The literature gives a max. of 1000 w. power handling. I trimmed
the "stinger" to about 43 inches for a SWR in the >1.2:1 range on
28.450. The package gives a chart for reference in cutting; I recommend
trying a slightly longer length, as cutting off small bits at a time
works better than the other way around.
Good luck.

1592. What it worth? Kenwood TS-430S

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-01 03:48:21 UTC
From: John Reed <jreed@NOSPAM.thor.atl.ga.us>
Message-ID: <t7hn0ipd8lurb8@corp.supernews.com>
Source record: 65166

Hi folks.

I haven't really gotten this radio ready for sale, yet - and frankly, I'm a bit reluctant too - it was my first HF radio - bought used back when I was in high school (worked all summer for it) - but in any case, it's a spare now. But there is some sentimental value with it.

Kenwood TS-430S

The radio has the FM module installed (very rare to find) - as well as the AM filter (a must if you are going to do 75m AM). The radio definately shows its age - having been a 1994 or 1995 production item. But, it's relatively clean - has some scratches, but none of the buttons or labels are worn off. It works completely fine. I've used it as my only HF rig since 1989. It's been modified for 1.8 to 30mhz transmit and receive (a simple mod - just pulling a jumper from the board). I had a blast using this unit in AF MARS, Civil Air Patrol, and dragging it out to field day several times and giving it a good solid workout.

Kenwood AT-250

This is the outboard automatic antenna tuning unit for the TS-430S (and the Kenwood 140/680). This was bought new. The only problem is that the display lamp is intermittant. It's too deep in the unit for me to get in there to replace it - or at least, it looked that way the last time I tried to go in there and fiddle with it (several years ago).

Kenwood PS-430

This is the matching speaker unit for the Kenwood 430, 440, 180, etc series of radios. I bought this item new.

If I do decide to sell, I'd like to sell the entire thing as a package. I have the original boxes for all of it.

Anyway - what's a fair price to ask for the whole package? I've seen 430's going for around $300 - $400, the speaker for $75 or more, and the Auto Tuner for around $250. But adding that together, even I wouldn't buy the package for $700 - you can get brand new ones for not that much more.

Thanks!

John, n4tii

> John, n4tii

Well, yes and no. $700 isn't going to buy you as much station, unless you're going for a 706 because it's compact. $450 to $500 isn't unusual for a 430s with FM installed, and narrow CW and AM filters, along with the MARS mod and VOX. The AT-250 is a solid $250, and the speaker SP430 is about $60 to $80, depending on condition.

Do you have the matching power supply? If you do, and it is a PS-50 (heavy duty), it's worth at least $100 more than the PS-430 or whatever the model number was, worth about $100 to $150. Your complete system with the medium duty power supply could net as much as $1K to the right informed buyer who knows that FM is installed, along with whatever filters you have added. The casual buyer will likely pass it up.

Good luck on the sale. I have the exact same station with the PS-50 and the MC-80 desk and TT hand mic and mobile bracket. I may be doing the same soon, as I haven't run HF since before this last cycle got good. My last contact was on 10M in 1998. XYL gave me too much flack about the old antenna farm, so we packed it in...

Greetings...

Up for trade this time is a BEAUTIFUL, MINT Ten Tec Jupiter...Yup, the one EVERYONE is looking for! If you are not familiar, this is the same rig as the Ten Tec Pegasus, but has the front panel on the radio, for you ops that don't like computer controlled rigs. You can control this rig either by PC or the front panel. This rig was new in 11/2000.

I am looking to trade for another mid/high range HF rig. Such as a TS-940SAT or a TS-950SD. Maybe a TS-570SG???

I am really looking for a trade only. I will include the remote encoder/VFO for the right trade.

If interested, please contact me. My wife is having a baby tomorrow (02/02/01) so I might be a bit delayed in contacting you, although I have my cell phone in which I can access my AOL e-mail.

I would PREFER a 'semi-local' trade...I am within driving distance of Chicago, Madison, WI, or the Twin Cities...However, I will listen to trade offers from 'wherever...'???

73, es gud dx de N9LXX~~~

Hello!

A bit off topic may be, but please help! This is posted also in
rec.climbing!

Next year there is a Bulgarian expedition on K2, first from my country
there. I have to tackle the question with radio communications, but
unfortunately there are to many variables :-(

Any info is appreciated! I will try also some radio-amateur groups.

Have you been to such expedition? What kind of radios did you use?
Model, maker or at least some specs (power, frequency)?

What about batteries? I guess the new LiIon are the best for cold
places.

In the base camp what kind of transmitter? Antenna?

Are there any special models for exp. use?

How long do you use a handy? Always on?

Anybody know of special regulations in Pakistan?

Thanks in advance!
Kalin.

AFAIK,the open 1/4 wave cable is a short circuit for the concerning frequency.Though he should take the frequency of the tv-channel for the 1/4 wave calculation.

Body handling: HTML body converted to readable text

For sale: High quality new Modutec VU meters at a reasonable price.

These come complete with mounting hardware in the new package.

I have up to QTY 20 available at the moment for $6.00 each.

Brand new VU meters, in unopened package
Dimensions: 2.25" X 1.75"

Mounting hardware included.

Picture is at:
http://www.geocities.com/CapeCanaveral/Runway/4161/imag/vumeter1.jpg

OR see my web page with complete details at:

http://home.cfl.rr.com/happysurfer/meters.htm

(To E-MAIL me remove the 'NOSPAM' in address!!)

1606. VS-1PX, Replacement Voice Synthesizer board for Kenwood

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-01 12:38:43 UTC
From: Chris <c_sieg@conknet.com>
Message-ID: <3A7958D3.8BA23F05@conknet.com>
Source record: 65180
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Hi Kenwood Fans,
We have newly manufactured VS-1PX voice synthesizer boards available to add the
voice feature to your Kenwwod transceiver. This board is used in TS-940, TS-440, TS-711A
TS-811A and other Kenwood products. We are manufacturing the board only, you may need some
cables for certain installations. Take a look at

http://www.piexx.com (Then click on the PIEXX logo)

Thanks,
-Chris

Mint condition Yaesu FT-1000MP for sale. Includes four optional filters, two 500 Hz and two 250 Hz (8 MHz and 455 KHz IFs). Also includes mic., all manuals and original boxes. Purchased August 1998. This is a fabulous radio. Asking $2400.

If interested, contact Jeff Parker at parker@ll.mit.edu or call evenings before 10 pm east coast time (718) 275-9609.

From: mark kenward <ae8844@wayne.edu>
Message-ID: <3A798426.255238AC@wayne.edu>
Source record: 65186

John, I too have the EXACT set-up.

The rig might get $450.
I bought tuner for$175
Power supply $125 max
TOTAL $750.

Problem? No matter how good it is, it is near 10 yrs old. Unless it is
PRISTEEN, I would not expect much more.

Good luck, I hope you get $1 million!

Mark Kenward.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

If it is a TS-430S, it is a lot older than ten years old.

I bought my TS-430S in 1984 and a year or two later it was
superceded by the TS-440 and later the 450, which is now
long of tooth too.

It was a great radio for its day, but much more than $450
for the whole schmear is being unrealistic, UNLESS you sell
the components separately. Just my opinion.

Yeah - the 430 left production in mid 1985 I think. That's when the 440 came out. (When I was first licensed in 1988, the 440 was already an older radio, but the one that "everyone" had. If you were one of the club uppity-snots you had a 940.)

Based on all your comments, I think selling the parts separately is the way to go. I'm sure there are some 140 owners out there who would want the auto-tuner. I'll be cleaning up the radio in the coming days and will probably throw it up here and sell it individually with maybe a package deal to someone who wants the whole mess.

1617. Followup on bad coax from Radio Works

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-01 17:47:15 UTC
From: Floyd Sense <sentek@sprintmail.com>
Message-ID: <Dihe6.2495$ln1.202794@newsread2.prod.itd.earthlink.net>
Source record: 65193
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

A few days back, I posted an item about receiving some bad RG-213 coax from Radio Works. While they had UPS pick up the original cable, the replacement shipment was also defective.

When I called today about having them take back the replacement cable, they were just then inspecting the cable that had been returned. They told me they saw nothing wrong with the cable at all. I asked them if they'd looked under the several feet of black electrical tape I'd had to place over the damaged area so that it could be used for one rainy day (they hadn't noticed the tape - great inspection, eh?). They removed the tape and claimed they saw no holes and no defects. Admittedly, these were small holes, about what you'd make with the tip of a utility knife. However, one was large enough that when you flex the cable you could see the copper braid underneath. When I looked at that cable closely, I could clearly see that the jacket seam had not been completely sealed, resulting in the holes. They looked again and said they could see no damage. They ask me if I was talking about just something of "pin-hole" size (as if that somehow made it alright).

While they agreed to take the second cable shipment back, they refused to pay for the UPS charges as they had on the first, stating that it was their policy not to pay for returns a second time. The office manager then went on to explain that I was lying about the cable damage. I offered to put up $1,000 against her $1,000 to have a third party inspect the cable, but she explained how three people had already looked at it and saw no damage. Apparently, "third-party" has a different meaning in Portsmouth, VA?

I must say that I'm at a loss over this one. I've bought many, many hundreds of feet of coax over a 42 year period, and know a defective cable when I see it. It's bothersome to me that this outfit sees nothing wrong with the stuff they're shipping and would then accuse me of lying about it. What conceivable motive could there be for that?? If you do buy cable from these guys, for Pete's sake go over it very closely before installing it. If you don't know good coax from bad, here's some tips:

1. If the coax has lumps in it (like a snake that just ate), then it's BAD.

2. If the copper shield is badly oxidized (not shiny copper color) when you strip the jacket off to install the connectors, then it's BAD

3. If you run your hand down the cable and feel rough spots as if it had been drug along a concrete driveway, then it's BAD

4. If you can see the seam where the jacket was installed, look very closely and flex the cable to as to stretch this area of the cable. If you see pin holes in the jacket, then its BAD. If you can see the inner copper braid

through any of the holes, then it's REALLY BAD.

All of these conditions existed in the cable that Radio Works sent to me. They may also have all existed in the second shipment - I stopped looking after finding pin holes in the first 10 feet of the cable.

I've never heard anything negative about Radio Works before, and have no opinion on any of their many other products. However, I can assure you that at least one type of coax they're selling is just plain poor quality - make that defective. Furthermore, if you attempt to any such problems with them, you'll be subjected to the ignorance and wrath of their office manager (Judy?). I ordered replacement cable from The Wireman (no connection to them, but have received nothing but high quality cable from them over the years).

As you know, K2 is a very dangerous mountain to climb; some say that is
more difficult that Everest. There are a number of books on
climbing Mount Everest that have the actual radio equipment used
on the climb. Perhaps the K2 books, which are less frequent, may have
the same. Since this is a life threatening mountain, I would check
with those people who actually climbed K2 or Everest and determine
what they used for communications between base camp and the climbers
and between the climbers. Also find out any difficulties they had
with the equipment/antennas etc. Check several sources.
GET THE BEST; LIVES MAY DEPEND UPON IT.

Hey all,

I'm learning my Morse at this time, and have been wondering what type of key might be best to get.

Would it be best to start with a straight key or would it hurt to start with a paddle?

What is a good make of key? I looked up a straight key at AES, and was surprised at the low price, 7.95 IIRC.

i recently received a 1000 foot roll of rg213 with the same defects that
you are describing (NOT FROM RADIO WORKS THOUGH) i returned the reel to
the sender and ordered a reel of belden cable although i paid a few more
bucks for the cable my headaches were gone

I would suggest that you confer with several manufacturers, letting them know your intentions. They know their equipment's limitations; they've probably assisted in every possibly installation that exists. Also, their corporation name will be riding on the success or failure of their equipment, so they'll hopefully do their utmost to ensure a successful outcome. You might even be able to work out an agreement with one of manufacturers -- they donate their best communication gear for the climb in exchange for the publicity of it having done the job.

I wish your team a safe return! They'll be in my thoughts and prayers.

KH6O

Well, that is too bad.

It seems that the main issue with Radio Works is NOT that they have defective cable (since presumably they have nothing to do with the manufacture of the cable), but rather that they

1) did a poor job of inspecting it;

2) would not pay to return the 2nd bad cable (this REALLY shouldn't have happened because they REALLY should have looked at the 2nd cable more closely, based upon the experience with the first cable they sent you. You'd THINK that they'd want to be careful to ensure no future problems).

I think this kind of thing is important, and too bad for Radio Works because I've bought cable from them in the past and have been fortunate to not have problems. I was just looking to make another purchase in the coming weeks, but now due to your post I will look elsewhere, just to be safe.

This type of customer service is a huge pet peeve of mine.

I think that companies get away with poor service like this because people don't do anything about it. You have a bad experience with them, but then you and all your friends and aquaintences keep shopping there. Things will only change if people force them to realize they're not doing things right.

I was trying to buy a product from MFJ but had a question about it. I emailed them several times, and wrote them letters. They never did respond. Perhaps there is a secret to successful business that I don't know about, not being a businessman.

I bought some "RG-213" locally (Tucson) that was made by JSC. The stuff is total CRAP. I probably should have returned it but the seller is an acquaintence of mine and in a struggling business and it was the weekend when I was trying to install it.

There were bunched areas in the braid, what little of it there was, that could be seen through the jacket. I didn't see any pinholes but if I had, I certainly would not have used it. No way is this 'MIL-SPEC' but therein is the problem. The MIL specs aren't maintained anymore, so anybody can stamp RG-XXX on their product.

Fortunately this is only feeding an 80 meter dipole. For the beams I use Heliax and don't worry about it.

With rare exceptions, if I get screwed I complain. I write letters, I make phone calls and I will complain in person.

Most businesses want to know about problems. Often I am doing them a favor by telling them about their deficiencies. I figure that when I voice my complaint, I'm probably speaking for dozens of other folks that have neither the time nor inclination to do it for themselves.

I often get refunds, free hotel rooms or meals, not so much as payoff for bitching, but as a thank you for pointing this out.

On the other hand, it is a two-way street. If I get exceptional service I say so and I'm a big tipper if the service is top notch.

>know about, not being a businessman.

I can tell you that this "e-commerce" thing is never going to fly (and apparently it isn't) until the sellers start taking email inquiries seriously.

There is a west coast seller of high-end seats for automobiles. I sent an email to them, as their web site encouraged, to get info on a pair of Recaro seats for my Camaro. These things sell for thousands of dollars and I gave them the color of my car's interior, the kind of driving I do, etc and asked for more info and recommendations. Never heard a peep. So I called them direct (no 800 no.) and got an answering machine. I got a promise that they would call be back. Never heard from them. Maybe they went out of business. I certainly hope so and I won't wonder why.

1635. help hooking up a vacuum variable cap

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-02 01:33:19 UTC
From: "Max Donoghue (VE3TMT)" <mdonoghue1@sympatico.ca>
Message-ID: <z7oe6.33369$Pm2.611640@news20.bellglobal.com>
Source record: 65062

I have purchased a Jennings vacuum variable capacitor for use in my loop antenna, but having never used nor seen one before I have a few questions...

1. Where do I make the connections for the loop?

2. Is it a multiturn device? i.e. once I pass the point of obtaining a matched loop do I have to back it up or keep turning?

Here is a link to what it closely resembles.

http://www.jenningstech.com/pdf/cap/vacvar/ucsl500.pdf

All help appreciated

Max

Source record: 65061

Here's what appears on the cable: "IEWL 4062 213/u Type". I'm not familiar with cable manufacturers names other than Belden, so don't know who this one is. Anyone know?

To the person who mentioned MFJ not returning emails: I've had the same experience with them. Several emails, never a response. On the other hand, I have called them twice for technical support and not only got to talk to a real person (only had to wait a minute or two), but the guy was actually able to resolve a rather complex problem with one of their TNCs very quickly. Other than the excellent support I've received from AES in Milwaukee, this MFJ guy is the only one who's provided help when needed.

I replaced the defective cable with a shipment from The Wireman. They list their RG8 Type 113 as Mil Spec. I bought the variety of their 113 that's designed for direct burial. I went over it with a fine tooth comb - no flaws, no lumps or humps, very nice stuff. A bit stiffer since it has a heavier jacket and a foil shield inside the copper braid. The price was only 7 cents a foot more than the bad stuff from Radio Works.

Sounds like Radio Words got a bad shipment of cable and doesn't want
to admit it. I've order lots of things from them in the past, and it
was always good stuff. Too bad they didn't want to do the right thing
on your order.

One screw-up can really mess up a business.

Hey, Bob:

I picked up an HTX-10 at Radio Shack this week, and drove from Chicago to Milwaukee this afternoon to pick up an MFJ 10m antenna at AES.

As I understand it, my best chances of contacts are at local sunrise/sunset.

I was a little dissappointed to find NOTHING whatsoever at 7:00 pm Chicago time (2 hours after sunset).

Is this normal? I plan to get up and listen in to 10m on my Yaesu SW Receiver tomorrow at sunrise, and see what I can pick up.

What have your experiences on 10m been? Where are you located?

Thanks,
Mark Harris

Hi Floyd,

Doesn't Radio Works advertise in QST and, if so, doesn't QST have code of conduct for this type of thing...

I would be tempted to send it or a fairly good sized section to QST and ask them to mediate. It would be interesting to see if they would.

I have an ICOM IC-24 AT that I have been playing with for a while. At first, I had no display, no pll, nothing but audio and a functioning squelch. I have resoldered the broken connections that I could find, and now have all the functions but now have no audio. I looked around inside again to see if I did something stupid, but could not find any other broken wires, broken traces or solder bridges. Any ideas????

10 meters is a band that normally opens during the day. Not that it's
always open during the day. It's probably best on weekends, when a lot
of folks are home during the day -- and if it opens at that time,
there's good activity. But don't expect much at night unless there are
some locals on, and even then, it may be hard to hear anyone across
town.

Liked mine real good until it lost its sensitivity on VHF-UHF. Scared to guess what it'll cost to fix, just shipping the beast will be a problem.

Anyone know of a common problem that causes this. Its not the antenna or bad coax connector that has been checked.

Mark,

As previously stated, 10 meters is primarily a daytime
band. The sunrise/sunset scenario that you refer to
is known as the grayline propagation and is usually
used in context of the low bands 40/80/160 meters.

There is a pickup in signals as the sun rises and sets,
but again, on ten the daytime is the best time! You will begin
to hear signals as the sun peeks over the horizon, and the
signals will follow the sun during the day. After the sun sets
there MAY be some propagation to the west, but that is unreliable
at best.

Have fun with your new rig!

Yaesu FT-6200 mobil 440/1.2Ghz dual bander. Excellent worker in good condition. Has scratches on case but front panel is like new. Can be remoted. Comes with original box and manual. Asking $500 but will consider a trade for FT-8100R.
I like this radio but have lost the need to use 1.2 Ghz. Call if interested or e-mail me.

FS: I got lots of help on the pricing for the speakers I listed for offer. I no longer have the 270G-1 but do have the 270G-2 and the 270G-3 speakers. They look nearly identical and match the 75A series receivers but the 270G-3 was specifically designed for the R-388, 51J-series receivers. Both are a 9+ in appearance and I have been advised that $285 each is in the low to mid price range of the speakers. Thanks for all those that helped me price these estate items. I have several other Collins receivers from this estate that I will list later. Mike @ (979) 693-1461 eves and wknds or email to: gspubl@tca.net/

Right now this band is rocking. On my base ssb station (only a 11m but conditions are the same) running 12w. with an I-max2000 vertical antenna, I can talk on ch. 38lsb from chicago to West Coast with ease. This band opens up just before sunrise and fades about an hour after sunset.

But in a moblie, my experience has been that more power may be needed because of the nature of mobile antennas.

Enjoy the skip! It really works!

IIRC early on in this thread it was stated that the cable was labelled "RG213 Type"

I have always considered "type" as in RGxxx Type or 2Nxxx Type to mean "It looks more or less something like the real thing" and treaded such products as highly suspect and most likely not meeting any sort of MIL or industry spec.

It's right up there with "tested", especially for semiconductors. Sure they were tested, that's how the manufacturer determined they were rejects.

Well, they made no claim that the cable is Mil Spec. However, I think it's reasonable to assume that something sold as coaxial cable is at least capable of keeping water out of the inside, regardless of the manufacturer or price. Here's what Radio Works says about their RG-213 cable, followed by what they say about their RG-213 Plus, which is what I purchased.

"RG-213 is the standard 50 coax replacing RG-8 which was the popular choice for years. RG-213 is similar to RG-8 but is built to a much higher standard."

Now for the "plus": "There are always was (sic) to improve a product and that is what was done to RG-213 Plus. It features an improved braid and even better quality, non-contaminating jacket."

While the author may have been given to hyperbole, I think it was reasonable to assume that the stuff wasn't reject junk. If this stuff is their very best, I pity the guys who buy the cheaper stuff!

1674. Need help Kenwood KSC-14 charger.

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-02 22:15:12 UTC
From: on4pj <on4pj@swing.be>
Message-ID: <95fbmlnp2@news1.skynet.be>
Source record: 65100

Hello and thanks for reading my mail,
Recently I
inserted a defectuous Nick-Cad battery into a KSC-14 charger.
Some elements were having short circuit and probably some diodes didn't like
it.

The led indicator that should be Green when no battery is inserted, goes
orange even without battery.
The other charger part is running well.

Following voltages are found on the pin-contacts:
1) broken insertion part:

```
__________________________
| U + U + U + U - |
| | | '+21.34v |
| | '+22.2v |
|_'9.57v ___________________ |
```

2) Good working side:

```
__________________________
| U + U + U + U - |
| | | '+21.34v |
| | '+22.2v |
|_'17.58v ___________________ |
```

(So: fautly voltage = 9.57v OK = 17.58v).

Does someone know the probable faulty component ? I'm sure this must be
some well known
problemn, but I did not find any help on the Kenwood-tech sites.

Some diodes are not easilly reachable... so before I break the charger in
pieces I though of calling
for help.

Thanks a lot in advance for any info.

President HR-2510 AM, FM, CW, LSB, and USB Tranceiver with Chipswitch installed. This radio receives and transmits perfectly however the main VFO knob only allows for increase of frequency. The stock mic UP/DOWN buttons work perfectly as does the UP/DOWN buttons on the front of the radio. This radio was in a box and worked perfectly upon being stored. Apparently it was jostled which resulted in some loss of connection with a portion of the main VFO selector. Also, this radio has a bracket for another smaller radio mounted on the top, and the whole case appears to be repainted. It fires up fine and TX/RX is perfect. Guarnteed not DOA. Good project for a tech familiar with the 2510.

$120 plus shipping.

Please email for any additional info.

Source record: 65107

I have fixed several problems in mine myself to avoid the hassle of shipping it off.

There was a service bulletin that mentioned the following sysmptoms: "Low or noisy regulator voltages detuning front end varactor tuning diodes, if voltages noisy or bad, replace faulty electrolytic caps in regulator unit."

ICOM also suggested that D1 and D21 the pin diodes that bypass the attenuator could be defective.

After 6 years of occasional use, I replaced all the filters in my power supply. The big ones 4700 UF were expensive, $22.98 each. They are expensive because they are low profile. I think you will find there is room for taller caps, and you can save some money. I changed: C5, C6,C7,C9 and C14. Make sure the power supply has a small load when you test it out, otherwise the voltage will approach 18 volts unloaded (Due to bootstrap resistor in the design). Once loaded it will regulate well. (If you remove the DC shorting jumper from the rear to test the power supply, make sure the power supply is off before you replace the plug or you will have an 18 volt surge.)

How bad is the sensitivity in yours?

Also, I would suggest you buy a small computer fan and install it over the rear heatsink directed on the regulator transistor. Power it by attaching a plug to it that will fit the accessory DC socket on the rear panel.

I used standoffs with rubber feet to mount the fan to the heatsink fins, the rubber feet are pressed between the fins to hold the fan in place. The entire radio runs much cooler.

Date: 2001-02-03 07:30:57 UTC
From: kims417@my-deja.com
Message-ID: <95gc3i$it6$1@nnrp1.deja.com>
Source record: 65114

I need advice on how to deactivate the Priority channel feature on my new VX5R. This is my first hand held rig. I noticed that "P" appears on one of my channels in the "MR" mode. The "P" appeared after I pressed "FW" and the "Band(SET-AR)" key. I tried repeating the key sequence to negate the priority feature, but the "P" remains on my display. Any suggestions?

Message-ID: <95gf0hksm1@nnrp1.deja.com>
Source record: 65116

Hello all,

I've got a TenTec Omni IV with matching power supply for sale. I've replaced it with two other radios and I have no more need for it. It's 10-80 meters (or is it 160.. hmm) and works great.. Have the original owners manual thats in fair shape. When I was in Alaska, I worked all of Europe on a G5RV with only 100 watts. The rig and power supply are in 9 1/2 out of 10. Some small wear marks is all..

Asking $350 for both plus shipping and you decide how you want it shipped.

This rig is great for new amateurs as well as collectors.

Date: 2001-02-03 08:24:46 UTC
From: BamBam <kl0an@my-deja.com>
Message-ID: <95gf8c$ls0$1@nnrp1.deja.com>
Source record: 65115

Hello all,

I have an R.L. Drake Antenna Tuner for sale. It has a meter on it that says 300 watts although I've never run more than 100 watts thru it. Used it with a TenTec Omni IV and G5Rv to work all of Europe from Alaska. It's got some wear marks and a couple scratches on the case but, the front is in excellent shape.

I'm asking $150 plus shipping however you chose to have it shipped.

Looking for one of the Alinco dual band rigs that came out a couple of years ago.. Credit card size, 1/2 inch thick or so.. OR one of the Radio Shack Dual Banders that are in the stores now.

Let me know what you have and maybe we can make a deal.

Oh, so by not selling them a decent amplifier, you think that's going
to stop them from getting another amplifier? They'll just go out
and probably end up with something WORSE that causes more
broadband splatter problems. The "don't help them" approach
is feeble minded at best; you're not stopping anything.

The better approach is to try and tell the folks how to use
them correctly and hope they follow your directions. At least that
would actually have a chance in hell of working.

Why does an anonymous person care about something perfectly
legal, i.e. the posting of an ad for an amateur radio on a forum which
provides a good source of experimental components and
legally usable equipment?

A search of newsgroup archives will demonstrate, in my opinion, that he is
trying to intimidate and harass people.

Why does Voobner engage is such intimidating behavior? Why
does Voobner seek to limit free speech and limit lawful activity?

Voobner posts anonymously, thus is a troll (albeit dangerous).
He is also a coward.

WC1J

Clearly identifying myself thusly demonstrating that you have
no power to intimidation me with your threats or actions of forwarding email
to Riley Hollingsworth at the FCC.

Voobner's real identity will be uncovered if he engages in
actionable behavior.

HI
i ues a Screwdriver off the back of my moble home it works very will
it stick up pass the top of the roof it is only up abt. 6ft. of the
grownd so i can take it down for use on the VAN . i thank one of the
reason it work so good is the hold moble home is the grownd plan steel skin.
to take off just undo power plug (power for tunning Ant.) amd lift off
I thank you would need some kind of grownd plan a long wire or some
thing

No, not as long as there are people with your high respect for the law
out there.

> and probably end up with something WORSE that causes more
> broadband splatter problems. The "don't help them" approach
> is feeble minded at best; you're not stopping anything.

Help them? You mean sell to them and make a profit don't you?

>

Until the next profiteer discovers there's a market for even cheaper and
dirtier amps and out there.

> -Mike

Any arguments supporting sales of amps to illegal operators are simply
justifications for profit, nothing more.
The unethical profiteers are at least as guilty as the 'freebanders' for the
state of our bands.

Mike,
At best you are a missguided tool of the illegal radio profiteers.
At worst, you are a co-conspirator in the destruction of amateur
radio. That is, assuming you are actually licensed. If not, then
we all know what you are.
Steve..AI7W

Source record: 65124

I don't think you can eliminate the priority channel. I know you can change it. To set any memory channel as the priority, put it in memory mode, hold down the (FW) button for 1 sec., use rotary knob to get to desired frequency, then push (BAND) button. You will see a "P" beside the channel number.

From: cammeres@spam_be_gone.uiuc.edu
Message-ID: <txYe6.615$DL1.7627@vixen.cso.uiuc.edu>
Source record: 65127

i'm thinking about buying a 6m mobile radio. i do not want a radio with
full hf because i don't want to spend that much money and because i'm
an apartment dweller and don't have the space for hf antennae.

the alinco radio looks like it will do what i want, and it is only $250.
does anyone have this radio? how well does it work? does anyone know
of other radios that meet my criteria?

for the antenna side of things, i don't quite have space on my balcony
for a 6m dipole, so rather than constructing a loaded dipole, i'm thinking
of buying a 6m magmount antenna. any recommendations for 6m magmounts or
should i do something else for the antenna?

thanks,
sc

I believe (but hope to be proven wrong) that this falls into the
same category as deleting a memory -- can't do that. Well, perhaps
it can be done by a microprocessor reset, but I've not tried
that. The priority channel can be moved. I remember doing it
once, but I can't find the instructions in the manual.

QUOTE..."Why does an anonymous person care about something perfectly legal, i.e. the posting of an ad for an amateur radio on a forum which provides a good source of experimental components and legally usable equipment?..."...."A search of newsgroup archives will demonstrate, in my opinion, that he is trying to intimidate and harass people...."
Yes, this fruitcake is harassing & spamming a lot of legitimate Licensed Amateurs, just for legally posting buy or sell threads of 10M & other equipment on Rec CB or REC scanner newsgroups. As most Amateurs already realize, those groups ARE a great (& better!) source of 10M gear than even some of the Rec Amateur sites, & this moron should mind his OWN business.

Hello,

I just obtained a Lear Learadio Model RM 402C Aircraft Radio. I am looking for ANY information on this radio. I also am looking for a copy of the manual & schematic. Any help would be greatly appreciated! I think that is may be from the 1940's or 1930's.

If you have any info on this unit, please Email or call me.

Email: radiotek@pacbell.net
Phone: (661) 272-6949

Thank You & 73,

Mike KQ6MU

Sorry to learn of the bad coax.
Did you pay by credit card ? Try to dispute the charges and even if
rw wins, they will have to wait for their $$$.

I have purchased from wireman and cable experts. good people, good coax.

Kenwood TH-G71 & D7A Buyers/Owners Note...

Greetings....A brief tale of woe here in the hope it will save others some of the grief I and others have had with this radio. Two issues (maybe related, maybe not); the radio parting from the belt clip and the eeprom (or?) going flakey.

- Shortly after buying my G71 I brushed up against a screen door leaving the house. I heard a noise and looked down to see my new radio laying face down on the concrete. At first I thought I'd failed to clip it properly to my belt but discoverd the belt clip still behind my belt. This happened two more times. The last time the radio tumbled down about 15 feet of stairs and smacked into the wall at the landing. The battery clip boss on the battery was cracked this time (maybe it happened before and I didn't see it). Anyway I epoxied the clip to the battery but never trusted it to stay attached so I had to carry it in a pocket. This was so convienient I went back to carrying my old Yaesu (in 3+ years it never fell off my belt). So I reccomend if you have or buy one you epoxy the clip on and get a spare clip for any other batt you have (or buy one of the aftermarket batts with a studier clip/battery). The D7A HTs use the same clip but I don't know if they have the same problem (could have been too thin a battery case allowing it to flex or crack)

- I put the radio in a drawer in the office and left it there for about 6 months. I went to a ham show and while there bought a new battery (and a V7A). I dug out the G71, put the new batt on it and charged it up. When I turned on the radio I got the "Wait..." on the display. Never saw this before. The radio woke up but memory was empty. It also seemed to have "slipped" into european mode, ie., VHF and UHF ranges were off US spec, VHF step was 12.5, etc. I was able to do a hard reset and after a few times it corrected itself. Programmed my freqs into it and it worked fine. When I turned it on the next day I got "Wait...", all memory was lost and it thought it was in europe again. Well, I can't get it back to a US operating config (won't go over 145.995 in VHF and is stuck in 430-440 mode UHF). Whether this is a result of the hard knocks the radio got or a design flaw or poor assembly I don't know.

I've posted this info to a number of ham radio message groups and to many of the ham message boards. Kenwood "Customer Care" tells me that neither of these issues is a common problem yet I get messages from others saying their radio has fallen off too, has a cracked battery or are seeing the dreaded "Wait..." message/memory loss too. One guy wrote me and asked if I wanted his belt clip...his radio is somewhere on the bottom of Lake Havasu in Arizona. Noticed the number of busted G71's being listed on eBay? The busted ones all seem to have broken batts

and/or memory problems. Needless to say I don't believe Kenwood...if I've heard over over a dozen owners with problems similar to what I experienced there must be a lot more out there.

Kenwood says they can't give me an estimate on what it might cost to repair and to send it in (and that an estimate cost $35 if I don't choose to fix it). I asked them to estimate worst case but the fellow at Kenwood emailed me that he didn't fix the radios so he had no idea...send it in. I asked him to check with the repair group (I assume they have email or phones) but never heard back. I suspect the flakey eeprom (?) is a surface mount part on a board that would be prohibitively expensive to replace and don't want to pay $35 to find out it's not worth fixing. So basically I have G71 that will operate in VFO mode in the lower half of the 2m band. Hope this doesn't happen to you....Beware!

1715. FS: TenTec Omni D w/ matching power supply.

Hello all,

I've got a TenTec Omni D with matching power supply for sale. I've replaced it with two other radios and I have no more need for it. It's 10-80 meters (or is it 160.. hmm) and works great.. Have the original owners manual thats in fair shape. When I was in Alaska, I worked all of Europe on a G5RV with only 100 watts. The rig and power supply are in 9 1/2 out of 10. Some small wear marks is all..

Asking $350 for both plus shipping and you decide how you want it shipped.

This rig is great for new amateurs as well as collectors.

Don.. I have a few Kenwood HT's.. and one thing that seems to go wrong if they are left uncharged for long periods of time is that the internal battery used to keep the memory goes bad, and will no longer hold a charge. This is generally a very small button type battery soldered to the PC board. Give that a look-see and let me know if it ends up having been your problem. (may have even come unsoldered from the PC board during one of the bounces.)

Brenda Thanks for your suggestion...it was one of the first things I checked
but it uses an EEPROM and doesn't have or need a memory battery...wish it were
so simple. Don

1731. Capacitance hats

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-04 05:33:01 UTC
From: jason_hsu@my-deja.com
Message-ID: <95ipieaak1@nnrp1.deja.com>
Source record: 65006
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.misc,rec.radio.amateur.equipment

I understand that capacitance hats are a loading scheme used to work low frequencies with a shortened antenna. Capacitance hats are more efficient than inductive loading coils but aren't very practical for mobile use (due to the impact of the wind).

My questions:
1. How close to the top of an antenna must the capacitance hat be? Does it have to be at the very top, or can it be several inches below the top?
2. If I buy a Screwdriver antenna, can I use a shorter whip antenna combined with a capacitance hat if the longer whip makes the overall antenna height too great? (I live in an apartment, and I am interested in buying a Screwdriver antenna.)
3. Can I buy a capacitance hat from vendors?
4. Are there formulas that one can use to calculate various performance parameters of a capacitance hat?
5. What are the ramifications of different capacitance hat designs? Designs include a single wire, disk, circle with spokes, and spider webs.
6. How do you build a capacitance hat? I imagine that various mechanical issues (supporting all the conductors, keeping the capacitance hat from sliding down the whip, etc.) come into play.

My Kenwood TS-690SAT suddenly refuses to transmit. Is there anything I should check before I pay for a ride to Kenwood and back? I checked the menu selection that disables transmit. It actually attempts to key up, but no power out.

Thanks in advance!
Keith, KB7M

Hello

I posted a letter on here a few weeks ago asking about the different versions of this radio. Having looked at the FT-900AT/CAT I think I will start with the basic one (FT-900). Can anyone give me there opinion on this version or possibly a review.

Thanks

Richard

With or without a autotuner is no big deal, since, like most ATUs, it
can only match a narrow range of mismatch anyway.

As an owner of a FT900/AT, I'd STRONGLY recommend you find one with
the filters you think you'll eventually want. Putting in the CW
filter is a pain due to the dissembly required, but putting in the SSB
filter is a major PITA, requiring you to desolder and remove the
ceramic filter.

There's a decent review on the arrl site, and lots of user comments on
www.eham.net.

Most owners love their 900 ... some controls remain on the radio when
operating with the head remotely, but I've not found that to be a
problem, it seems to have been well thought out.

QSK is smooth, without thumping the AGC. The built in keyer, although
without memories (I don't care) works fine.

Repeater operation is easy, and offset is automatic or manually
selectable.

Good receiver, quiet, no multilevel menus (great when mobile). The RF
shift and notch filter are effective, although not automatic. Not
without flaws (as any radio) but most of the 900's shortcomings are
subjective, and not related to performance.

I'm dying to try a new radio with DSP in the IF, but I think the 900
stays ... it's a keeper.

I used a 2 feet diameter hat some years back. It was constructed from
#6 solid copper wire. A 2' diameter circle of #6 with 6 #6 spokes in
a hexagon configuration. It retained its shape very well up to... uhhhh...
whatever the freeway speed limit was ;-) It did deform a little when it
encountered a low flying tree at 50mph, but was not difficult to repair
once we stopped...

Hi:

Are you perhaps looking for a radio that is in
like new condition. I have one that has never
been installed. I think this also has a extended
warrantee as well.

The model is a D44KXA7JA5BK which is a UHF Spectra, comes
with Brand New Power Cord, Ignition Cord, Bracket, and has
a good mic and A5 control head. The Control Head looks like it might
have been changed, but other than that, everything else is perfect.

$695.00+$15.00 for shipping and handling

Photo can be seen @

http://www2.4dcomm.com/metrotech/spectra.jpg

Terms:

Acceptable PrePayment in the form of a Postal Money Order PayPal (If
immediate shipping is desired) or a Personal / Business check is A-OK too if
you do not mind a Short Shipping Delay due to bank processing time. This is
required only the first time or two as once you are in the data base,
PrePayment is no longer required

GP-68 rapid charger Motorola part # PMTN4020B
I presume it's an US version which is rated as a 3 hour rapid charger
@ 120VAC w/insert. This style charger requires that you place in an
insert to accomodate the GP-68 radio. Unfortunately the part number
for the insert is unknown. All I remember was it cost me about $ 8.00
for the insert. The polarity and amp info was included with the
charger/insert documentation. Voltage rating depends on where expect
to operate the unit. Most of the US users (I believe) would need the
120VAC version.

1762. TS430S fault.....help please

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-04 22:49:52 UTC
From: gary <gary@g4loe.freeserve.co.uk>
Message-ID: <95km6rurf1@news8.svr.pol.co.uk>
Source record: 65038

Hi All,

I have just connected a 2m tvtr to the 430 which has caused a major fault with the rig.

The ptt or send no longer cause the rig to transmit (even without the tvtr), however if I set the VOX on and then use the ptt the rig will operate.

Can anyone help me pinpoint where the problem may lie, I have been sweating over the circuit diagram for some hours now and feel that it may lie somewhere in the switching transistors.

Any help would be really appreciated.

thanks in advance..73s.....Gary G4LOE

The IEWL stands for "International Electrical Workers League" which just means it was manufactured in a union shop. (That may be the source of the problem)

One sure cure... use LADDER LINE and forget about the braid and the cover and the pinholes. Happy Trails JJ

Read the procedures for modifing a Yaesu FT-212 RH for out of band transmit. When you perform this modification, the rig will have been reset - and you will program in the upper / lower limits over the radio.

There's a way you can throw an FT-212 into this mode by shorting two pins in the mic connector, but not sure which ones it is.

John

Message-ID: <B_of6.1993$uw2.356617@paloalto-snr1.gtei.net>
Source record: 64956

The Mem/Chan knob is much faster, try it, you'll like it. Don't need a
finger knob. 10kc at a step....

1797. 8950 Vacuum tube ???

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-05 11:17:47 UTC
From: mystique224@home.com
Message-ID: <3A7E8E41.A8EF7E86@home.com>
Source record: 64973

Good Morning Everyone,
I am posting this unusual request because I had a customer bring in this piece of equipment the other day. It is a Ham series amplifier that uses three 8950 final tubes and 1 8950 tube as the driver. Anyway, all of the tubes are less than 30% on my tube tester. After some research, I have found that these tubes are extremely hard to find and when you do find some, they are usually used and very expensive. My question to you fine intelligent people is "Is there a replacement tube of similar characteristics that I can substitute for the 8950's or maybe a modification that can be done to allow the amplifier to use another type of tube?" After doing my research, and correct me if I am wrong, it seems the 8950 tubes use a 12VAC heater voltage instead of the normal 6VAC. Any and all help is greatly appreciated in advance.

Sincerely,
James, Owner/Operator

> mobile use (due to the impact of the wind).

True. What they used to do was make a ring of aluminum
with 4 "spokes" to couple it to the radiator. This way the
wind would blow thru it while mobile.

BTW - Don't forget that Art Bell returns tonite to late night radio.

see the URLs--> www.artbell.com and www.coasttocoastam.com

Tom:

HF rig internal tuners operate over a limited range, generally the impedance must be between
16.7 ohms to 150 ohms. Same is true for SWR. If the antenna SWR is much above 3:1, the internal
tuner cannnot obtain a match.

Al, W2JUV

Although the 6M operation will disappoint you unless you use an external
antenna. It does very poorly (not surprising, really) with the supplied
"duck".

Is there an available heavy duty metal or rugged spring loaded plastic clip for the VX-5R like the Yaesu "Clip 10" for the FT-50 or the metal clips for the Icom and Alinco radios?

1812. Yaesu MD-100 & FT-847 Audio Problems

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-05 18:14:18 UTC
From: Reuben M <ruby@cloud9.net>
Message-ID: <t7trc3n091749e@corp.supernews.com>
Source record: 64986
Cross-posted to:
alt.ham-radio.hf,alt.ham-radio.mods,alt.ham-radio.ssb,alt.ham-radio.vhf-uhf,rec.radio.amateur.dx,rec.radio.amateur.equipment

I've been struggling with this problem for some time now. I guess I should of called Yaesu a lot sooner, or maybe they should of made this information known. (maybe they did?)

It seems that when the MD-100 mic is used with an FT-847, pin 5 and 7 need to be reversed. The operation is done at the bottom of the mic, NOT in the base or the plug to the radio. After reversing pin 5 and 7 I no longer receive complains about RF coming in with my signal. I think it was actually the electric noise from the fan at the back of the FT-847.

Good luck to all, mods are done at your own risk, so if your not sure how to solder send the mic to Yaesu for the operation to be done.

Reuben

What Mic are you using Keith? I had a similar problem with mine and the MC-60 mic. I eventually found that the kids were playing with it and switched the on/off switch on the mic boom to the "on" position and the PTT switch on the base refuses to operate. Switched to the "off" position and all was back to normal.
Regards

Rob ZS5LA

Good question. Get a radio with a removable face and keep it with you.
Since most rigs will receive without the mic plugged in, unplugging it does
no good. Most cops (that I know) will ignore it if she was not actively
listening. Maybe a good idea to get her licensed? I tried the argument
with my wife. Did not work. She has no radio in her car. I do in mine.
Although my wife rarely drives my vehicle, I have never given it much
thought, although it did justify to her me getting a little Yaesu FT-90R to
keep ready to pop in her car with a mag mount. It isn't the radio that
bothers her--it's the antennas!

What sort of license does one need? A ham license? A police badge?

> Does anyone here have a similar problem?
>How do you get around it??
>
>Thanks
>Bill
>

I've heard of laws that forbid receiving cell phone frequencies, but
this is the first I've heard of it being illegal to listen in on
police or other public works frequencies. You might check your local
police force, to make sure such a law exists.

If it is a problem, then get an Icom rig that does not receive police
frequencies. Call your local police Public Information Director, and
ask what frequencies to avoid, and then buy accordingly.

I have a TI model 85 I do not need. I only used it for 2 classes and completed my degree. Calculator runs on AA batteries and I do not have the manual. Unit is in real nice shape compared to some of my classmates units.

Best Reasonable Offer.

I've had good luck with Amateur Electronic Supply, 1-800-558-0411 or
http://www.aesham.com

They also put out the nicest, fattest, full-color catalog of ham gear
that I know of. You might call them and ask them to send you their
free catalog. It's a great reference book for virtually every piece of
ham gear that exists.

You can also check out mobile gear directly at the web sites of the
major ham manufacturers:

http://www.icomamerica.com/
http://www.yaesu.com/
http://www.kenwood.net/products/
http://www.alinco.com/

Good luck!

Relax, Dave. They're looking for someone to design the transmitter,
not for someone to actually try out the transmitter (those ads will
appear later).

Besides, you already have a transmitter inplanted in your head.
Didn't you ever wonder why you would get some song in your head,
huming along with it for days? Some lab technician was just having a
little fun listening as you tried to sing something else in an effort
to forget the first song (you don't sing very well, especially when
you're thinking of another song at the same time).

I have an ICOM IC-2SAT with charger and manuals, will let it go for $120,
shipped anywhere in the US.
Also have a Kenwood TM-2530A mobile unit.. good rig, but the audio output IC
went out a while back and I had to hokey an LM-360 or equivalent circuit
into it for lack of access to the proper part. The audio is good this way,
but could be louder. Will let this go for about $100. Again, this is
including shipping within the US.

Even in the OFF position, the keyboard is being scanned. This needs
power. A full LiIon battery will be empty in roughly a month (I did this
estimation earlier, don't ask me for details). I leave the battery latch
open (inside the leather pouch) when my VX-1R is not in use.

For all VX-1R related info, goto

Hello,
I have a SWL receiver: SOMMERKAMP FRG-7000 with the frequency display always off. I just have the schematic for the receiver portion and it is very difficult to investigate in the frequency display portion without schematic.
Could someone scan the schematic of the "Counter Unit (PB-1754)" and send me a JPEG file by email.
All experiences in maintenance of this part are welcomed.
Thanks in advance

I just got back into amateur radio after a three to four year layoff. The language has changed a bit since I was last active.

For instance, where did saying "QSL" or "Contact" come from?

Q codes are for CW, not phone. Saying QSL is the same as saying 10-4 to my ears.

Contact? I have no idea where this could have come from. The traditional method of injecting oneself into a conversation (which is rude if the conversation is between two hams), is to announce your callsign. If the participants want company, they will invite you into the conversation. If not, you will be acknowledged as the next in line for the frequency when their conversation is complete.

I'm not stupid enough to think that anyone cares about my opinion, so there's no need to be offended. It's just that even I, an ex-CBer during the seventies, can see some of the CB SSB language infiltrating the ham lexicon/culture.

Does it matter? Not really, but it does seem to make us seem a little less intelligent. After all, the rules for telephony state that we are to use plain language, not codes or ciphers. But then again, that's just my opinion.

I had the exact same problem you describe with my ts-50 three years age.
te rig was only 2 weeks old at the time, but the rig got extremly hot
the eat sink was so hot you could not even touch it. no xmit and the rig
kept crying help. I sent it back to Kenwood East. they put a new set of
finals in it and it has worked perfectly ever since. Hope this helps.

In fairness to "Jim", I want it made clear that at no time did I talk to Jim about the matter - I was unable to get by his "office manager" on the telephone. I have no reason to believe that he knows anything about the quality of this cable, nor how his people behave on the telephone. I did send Jim a letter on the matter, and am hopeful that he will do the right thing.

Hello. I have a Intech Mariner 2500 that I am trying to resurect. I need the programming info, the pin out of the molex plug on the back or a complete service manual.

Thank you,
Randy KB8ASO

NO on e I know of inspects every cm of coax on a spool before
it is sold to a customer.

Perhaps the originator can post a link to photos of the coax in question.

Remember, anything made by a machine can have a defect.

The Armenian judges gave this a 9.8 on the Olympic Troll-O-Meter, but they were over-ruled by the umpires in instant replay, who award it a 2.6.

The Armenian judges lodged a formal protest!

It was sufficiently trollish, of course, but way too obvious. It was poorly written, poorly executed, and was so incredibly lame as to lack the true drawing power of a really masterful troll. Maybe as high as a 3.1 for the intense stupidity of the premise, but a 9.8? Never! The Armenian judges tear their hair out, throw their balalaikas down in dismay, and perform the traditional Armenian Dismay Chant! They demand a recount!

Congratulations you figured it out....to continue.....more enforcement
that then forces the FCC to decide to terminate ham radio because it is
out of control.

Wonder how much money 75 meters will bring?

Source record: 64905

If anyone out there has experience with R/C in the 50MHz band I
would like to ask their opinion. I am looking to buy a radio and found
someone selling a 6ch PCM Futaba radio (and receiver) that used to
belong to a family member. They beleve it is about 8-10 years old.
I know that the FCC made all R/C radios go narrow band a while
back, but did that affect 50MHz radios? And if so, would this radio
likely be before that switch? I mainly want to be sure it would still
be legal to use (they have checked to make sure it works fine) and that
it would still be compatible with modern Futaba equipment.
Any advice would be greatly appreciated.

Someone is selling junk somewhere. This is not the first case I've heard of bad 213 coax. I also heard a guy on the radio talking about it, BEFORE Floyds post, saying they bought 1000 ft of 213 that had twice the normal loss. I don't know Jim, or Bob, or Elwood, or any of the other wire sales dudes/dudetts around the world, but someone IS selling junk 213. If I remember right, the company that sold the junk 213 to the guy I heard on the radio, WAS NOT radioworks. But I'd almost bet they are selling the same shoddy overseas coax. To me , these companies which apparantly are buying this bulk 213 are victims of shoddy product also. But I wonder? Don't they test random samples of this stuff before they sell it? MK

Folks,

I have a Kenwood TS-440s. I also have a YK-88CN CW filter I would like to install in it.

The instruction manual is very `terse' about the procedure for doing this on page 27.

In 6.1 (2) it says: "Remove the seven screws securing the IF unit to the chassis."

In 6.1 (3) it says: "Install the crystal in the appropriate location in the IF unit...."

However, when you remove the top, the IF unit is also a maze of harnesses and wires. The manual says nothing about them. Do they have to be removed to remove the IF unit?

In short, has anyone installed an optional CW or SSB filter in this rig, and able to recall what the procedure was in reality, and what pitfalls lurk for the uninitiated??? (Rig works fine now, I would like to keep it that way (;-)

Would appreciate any savvy advice...

MW-2 Wireless Remote Microphone for Yaesu FT2200, 5100, 5200 and 6200 Series mobile transceivers.
The MW-2 provides completely remote operation of the above radios by duplicating nearly every control on the front panel of the radio, combined with an FM wireless microphone, PTT switch, 16-key DTMF pad and up/down scan control buttons. The MW-2 can be operated up to 27 feet from its pickup unit, using infra-red for the control signals, and 49.85 MHz FM for transmit audio. The pickup unit connects to the microphone jack of the transceiver via a 12 foot cord. A lamp button backlights the keys for operating in the dark, and a magnetic mount lets you stow the MW-2 on any convenient metal surface.
Unit will be shipped double boxed in its original box along with all documentation. This unit was used only once and stored. (never got back to that project).

Asking $60.00 shipped CONUS. Payment by Postal Money Order or PayPal

Contact Rich, W6VX here or at 818/997-1217.

Havent operated on the old ham bands for a couple years now. I keep the license up to date, but there are just too many idiots on the air for it to be anywhere near enjoyable any more. don`t worry. the FCC is selling them off piece by piece anyway. Ham radio has had its day, and the ARRL and FCC let it go down the drain. It is now going to die a well - deserved death, and leave us all in peace. We still have the internet, and we can easily talk round the world on it. I stopped putting up with CB pond scum years ago, and since that is what the Ham Bands are on their way to becoming, I think it derserves equal attention .....

The downslide began well before the current license testing scheme was put into effect. If the bands are sold off, so be it. I'll take my entire share of the profits of such a sale down to the corner Starbucks and by myself tall caramel macchiato.

NOT! The ARRL gave up helping ham radio and improving things about two years ago. From what I see they're not planning to propose making things better in the future either. ARRL stratagy is like Outcome Based education, they don't want quality, only quantity.

If he had a license he is a HAM not a CB'er
Frankly Freebanders are like the Hams of old. If you look at the FCC
enforcement logs The Hams are out of control and need enforcement while
Freebanders are mature and working to improver thier knowledge, save lives,
promote freedom and democracy, and gernerally aid and improve the geneneral
welfare or thier comunities.

Vince, be pragmatic. If it means the survival of the ARS, then we do
the quantity thing, and let Riley handle the guys that think they own
the ARS. If there's not a real breakthrough on the actuarial tables
soon, the ARS is in trouble.

Tracy, pretend for a moment that I know nothing of the ARRL and the ARS.
Now explain your position WRT the ARRL, and identify the organization
that you believe to be the solution, and state why.

Thanks, Brian

I couldn;t agree more myself. while I won;t disagree that there are some

bad eggs in both CB and Amateur. the are not ALL bad. And improvements can be made if you go about it in the right way.

I am in the proccess of getting my ticket. and I feel that I am a responsible and LEGAL CB operator and I will continue to be courtious and respectfull on the amateur bands when I finally have the priviledge to use them. I have friends here in town that are hams, sometimes I go over to their house for coffee and they share their wisdom and experiance with me. I just hope that someday I can do the same with a new radio operator.

Good Job Brenda Ann ... i have also been a ham since 1978 code never interested me at all i passed every element of the theory more than once in hopes that one day i would get my speed up to 12 wpm ... well i never did study anymore code and now thanxs to the fcc i am a general. and the same as you i know more electronic theory and amatuer operating principles etc than many extra, advanced and general class hams who have been able to pass the code portion. for what its worth.

It's true look at your own foul and filthy mouth!
Ham's always use foul language and filthy talk on the radio just like they
do on this newsgroup. Freebanders know better. Freebanders are mature and
can express themselves without spewing forth filthy language.

Hello,
Can you help me please to find out SWR meter? Frequency range (1500 - 1700)MHz. Impedance 50 Ohms. If have, use N-type connector. I will accept new or used meter, analog or digital, depends on price.
I don't need Signal Generator included on that meter. Just only SWR Meter I need. I do not know what manufacture name.
I use for measure/build antenna will work at that frequency.
Please help me, maybe you can send the information to me by email : binton@centrin.net.id .

Thank you very much.
Binton H

There is no organization that is "the solution" more hams put thier
faith in the ARRL than any other organization and the ARRL threw it all
away,trampling the traditions of this once great pursuit one by one.TG

NJ has ham plates that do not say "amateur radio" on them.
Although they are obvious to other hams, a police officer will never
get the connection by observation.

Now, let's back up in time to when the Generals *got* privileges they had not worked for, when they were given phone privileges on 75 and 20 which were formerly restricted to Class A operators. No exam, no operating/license time restriction, no nothing - just fire up and operate.

Never seem to read much about that end of the stick, do we?

72/73, George W5YR - the Yellow Rose of Texas QRP-L 1373 NETXQRP 6
Fairview, TX 30 mi NE of Dallas in Collin county EM13qe
Amateur Radio W5YR, in the 55th year and it just keeps getting better!

The issue is not the legality of the equipment but whether or not you would be welcome or even allowed to use it at a given flying site.

The FCC regs you mention applied to the RC frequencies in the "CB" bands, not the ham bands. We can still operate anything that is otherwise legal on the ham bands.

But, some clubs and site operators are very particular about what equipment they allow to be used on their facility.

I still have and still fly a Kraft 8-channel FM rig on 6 meters (53.2) that I bought in 1982. No problem with my club, but you need to check with yours.

In addition to my earlier response to your question, let me add this thought:

RC equipment has gotten so cheap these days for really good equipment that it is probably false economy to try to save a few bucks by buying used equipment, especially *old* used equipment. The investment in time and money that you will have in the plane and engine can easily be much larger than what a good new radio system will cost.

Think about it and compare prices before getting into a losing situation.

I haven't seen one of those in 10-15 years, but if I remember right,
there is only a "low" switch. So you have high and low only. The power
is adjustable in the radio if you have to go farther than that. If
anyone know better, chime in... MK

1952, I believe..... I've done quite a bit of research into the changes in
Amateur licensing over the years... some big changes in 1924,1928, 1934,
1952,1967-69, 1990, 2000 (dates may not be 'right on' the money, but then
many of the changes were phased in over a period of time.)

Mark,
> Don't they test random samples of this stuff before they
>sell it? MK
No they don't.

I used to work at a coaxial cable importers here in the UK.

the 'Italian' manufacturer initially sent us over a selection of
different grades as samples. From memory they were poor to very poor to
some stuff I wouldn't give my grandmother.

The final question they asked via fax was "Tell us what you would like
printed on the outside of the cable!"

I'll leave that last one up to your imagination.

Buy Andrews.

I don't think I unplugged the cables when I did the filters.

I'd try to lift the board and solder the 4 pins without unplugging.
But, if you have to, the plugs all line up at re-assembly time.
(They've been in that position long enough to resist shifting position.)

Whether they do or don't, let's say samples looked OK. In any case,
if the first shipment was bad, the second shipment should have NEVER
been bad, since upon replacing bad cable they should have hand checked
every inch of the replacement, to ensure that there wouldn't be a
problem.

The main issue is not that the first shipment was bad, but that the
second shipment was bad, too.

The same place that other slang comes from, Ed. Years ago, we had very different meanings for "cool," "gay," "bad," and a long list of other slang words used in our everyday language. Since everyday language continuously evolves, it is a little unrealistic to expect radio language to remain static. In fact, I'm fairly sure you were using some words four years ago that hams didn't use twenty years ago.

> [snip] After all, the rules for telephony
> state that we are to use plain language,
> not codes or ciphers. [snip]

But for anyone who uses a ham radio, QSL is about as plain language as it gets. And, the last time I checked, "contact" was in the english dictionary.

1936. FA: RARE WWII Crosley BC-654-A Transmitter/Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-08 19:08:07 UTC
From: radiotek@pacbell.net
Message-ID: <3a82ee2b.61281000@news.nvbell.net>
Source record: 64812

I have a really nice RARE WWII Crosley BC-654-A Transmitter/Receiver.
This covers 2-6 MHz. Modes are CW & AM. The radio is in really nice
shape. This was the 1st American Radio to see combat in WWII!
The price is nice & there is NO RESERVE!

Please visit:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=552783644

Thank You & 73,

Mike KQ6MU

1937. TM-V7 WIRELESS REMOTE PROJECT STATUS

INTRODUCTION

Hello again,
my name is Vladimir and my HAM callsign is YZ7REA.
This is my second addressing to the general HAM population worldwide
in regards to this project. For those of you that are familiar with
the project goal I can say that I'm not gonna bore you too much. But
on the other hand I'll give a "short" brief about this project for those
that don't know whatta heck I'm talking about.
"TM-V7 WIRELESS REMOTE"... Sounds interesting? Well it sure is!
And it's simple too! For all of you that are familiar with this KENWOOD
mobile radio and own/would like to own one, this project will open a
whole new view. The goal of this project is to separate the detachable
front panel from the radio and establish the digital communication
between them at distances of several miles or even more. Why? For many
reasons. If you live in a heavily populated area and have problems with
TVI, live in an area where the density of HAMs is big or you just wanna
be "on a top of a hill" and be able to make contacts at larger distances
without using a lot of power or spending a lot of money on directional
antennas, rotators and tracking/positioning systems this project will
give you all that you need.

DISCLAIMER

Before I go further with explaining how the system will work
I have to say that this project will NOT be in compliance with laws in
some states or countries. Respect that as you respect the HAM code that
prevents you from transmitting outside the boundaries of amateur bands.
First of all let me tell you that I won't be selling this system to
anyone nor will I sell schematic diagrams or any PCB's etc. This is my
idea and I want to share it with HAMs worldwide. So, what you choose to
do with it is your own business. All I ask of you is that you mention
my name and callsign if and when you post any info about this project
on/in discussion forums, publications magazines etc. Second, if any of
you should choose to use my idea for commercial purposes I ask that
you write me an e-mail notifying me about that. Third and the last,
I'm not going to responsible if any of you choose to use this system
even if it means breaking the law in their country/state.

TECHNICAL STUFF

I'm working on the system whenever I have spare time on my
hands (and that ain't often). So, I'll keep you informed as the project
develops.

1. General info

According to the KENWOOD TM-V7 service manual the four pins that you
can see when you remove the front panel (LCD/control unit) are:

-----
[o] pin 4 - 9.6V
[o] pin 3 - GND
[o] pin 2 - Data out
[o] pin 1 - Data in

After measurement with an oscilloscope and volt meter I found this
data to be TRUE. What you should know is that data communication is
asynchronous with speed of 3125 bps (3K2). The control unit checks
to see if the panel is connected to the radio every 0.5 seconds and
if it misses two counts it assumes the panel is taken off and shuts
off the radio. So, this means that you need a FULL-DUPLEX link to
be able to connect these two together. The easiest (I'm not saying
the best) way is to use pair of full-duplex radios on 900MHz, 23cm,
13cm or any other band that has a "amateur digital communications"
slice of the spectrum in it. Of course you have to be sure to use
the band that is legal for this stuff e.g.: packet radio link freq.
I'm using a 3cm ATV FM transmitter with 5 sub carriers on each side
and no video "carrier". You can use any carrier from 5-8.28 MHz.
You'll need to relay the following signals from the CONTROL PANEL
to the radio:

1. PTT, UP and DOWN button control*
2. MICROPHONE
3. PANEL DATA OUT (3125 bps)
4. DATA TERMINAL TX
(connection from PC, packet modem, SB etc. max. 9K6)
5. AUX (used for remote switching of PA's etc.)

You'll need to receive the following signals from the radio:

1. VHF RX AUDIO
2. UHF RX AUDIO
3. PANEL DATA IN (3125 bps)
4. DATA TERMINAL RX
(connection to PC, packet modem, SB etc. max. 9K6)
5. AUX (used for remote switching indication etc.)

* Three button control via a single wire/carrier can be achieved by
using the 3 different tones. Something like CTCSS, but they can be any
frequency even hearable from couple of hundred Hz up to couple of KHz.
By using a PLL DETECTOR on the other side you can precisely determine
which button/key has been pressed.

2. Transmitter(s)

You can use many solutions from cross-band (example 23/13cm)
to in-band full-duplex radios. I leave this to you to decide. As I said

I will be using 3cm amateur microwave radios, both for PANEL and RADIO side of the link. Small antennas, little power, huge gain, simplicity of construction, great directivity and the most important thing good frequency separation in free space at antennas just couple of feet apart are why I decided to use this band for my project. As little as 10mW and a 36" dish will cover the distance of more than 15 miles if line-of-site is present.

3. Receiver(s)

Commercial LNB's, SAT dishes and SAT receivers with small mods can be used.

4. MODULATORS/DEMODULATORS

This really depends on the type of radio that you're planning to use, but bear this in mind. All the signals you need to relay are in fact NBFM signals. This means that you DON't have to use WBFM sound carriers like I did. There are certainly much better solutions than mine but this one, as I said before, was the easiest one for me since I already had some equipment that I wasn't using.

5. COSTS

This is also very relative, but if you use some old uW equipment for 3cm like I did it comes very cheap to have such a system. All taken in consideration the total cost for this system shouldn't exceed $150.

5. LIMITATIONS

Laws that prohibit this type of data transfer, line-of-site is a must, very bad weather like heavy rain, snow thick fog etc. can downgrade the system reliability. More than one TM-V7 WIRELESS REMOTE system at the same frequency in each other signal path can probably interfere with each other (I haven't tried this). And probably more...

6. BENEFITS

Just think about it for a sec!

Well I'll rap it up for now. Feel free to ask any questions regarding the system, but please don't ask for any schematics 'couse I still haven't drawn them yet. They're all in my head for now. I'll probably put more info on my web page later on once my system is up and running and monitored for some time.

****
I'd like to thank KENWOOD for "helping" me with this project and directing me to the nearest KENWOOD dealer to spend $40 for the Service Manual. Also thanks to KENWOOD technical support who told me that if they gave me the DFK-3C for this project they'd go bankrupt. :) I know that they get all kinds of weird requests every day, but I also know that every Tom, Dick and Harry don't make something like this and share it with fellow HAMs all around the globe.

****

As for me... No medals please! :) I'm proud to be a HAM!

Your HAM friend from YU-land
YZ7REA Vladimir

"QSL" as a synonym for "yes," or "message received" is very old,
perhaps almost as old as amateur radio itself.

But "contact," meaning "I want to contact you" is quite new, less
than a decade of commonplace use I think. I think it migrated to
amateur radio from the Citizen's Band, though I don't know if it
originated there, and I welcome corrections if I'm wrong. All I know
for certain is that it was almost never heard on the HF amateur
bands from 1968 (when I started listening) until the 1990s.

Personally, I feel that "contact" when used with that meaning is
outside the amateur tradition and also outside good English usage,
so I don't utilize it. The traditional amateur term is "break."

With all good wishes,

Kevin, WB4AIO.

You can get cheap Echostar receivers (model 2700) for about $85, with a card at Costco (old Price Club). They aren't Dish 500 ready, but I understood that you just need a Dish Network receiver.

Sir,,

You are wrong on the above. Besides breaking the law and interfering with legitimate communications of other domestic radio services, the "skills" of "freebanders" hardly qualifies them for the promotion of the welfare of the community--among other things. If that were true, how come when there's a disaster (flood, tornado, hurricane, etc) they don't call on the "freebanders" to help out instead of ARES, RACES, the host of hams who are not in the above organizations, and Civil Air Patrol? How come they don't ask for "freebanders" to pass traffic on 27.555 instead of hams on 3872 KHZ, or 14.300? In time of disaster, when other comms are down, more traffic is passed by HAMS than any other group.

All this bullcrap about ham radio being "dead" is wishful thinking, bud. And for every "bad" ham that "may" be heard, I can find TEN CBers just as bad or worse. BUT! Does that make CB itself "bad"? NO! For every ten of the "bad" CBers, I can find 20 good ones. For every "one" of the so-called "bad" hams, I can find 100 good operators. The FCC's return to enforcement is welcomed by the rest of the Amateurs and, we hope, that their activity will weed out the bad ops. The rest of us that get smeared by the activities of a few welcome the departure of the jerks. Same with CB: you can't judge the entire service by the antics of a few morons.

Heck, for all we know it could be coming from the contact managers everyone has on their computers today. Or it could be coming from the business world. I've noticed a lot of business people saying that today - the word "contact" both as a question and statement (meaning "will you contact..." as a question or "yes, I'll contact..." when answered back). In other words, who knows where this stuff comes from.

Some do. It is possible to purchase certified coax, in any length you desire. Of course you pay a nice premium for it.

I believe Andrews is one of the suppliers who will do so. You could check their web page to see if there is any mention there.

But this is only a test of the electrical characteristics - not for such problems as slits or holes in the outer covering.

1958. Re: MFJ-259B vs VECTRONICS 584B Analyzers--??

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-09 03:56:23 UTC
From: W0VX <djaksa@email.msn.com>
Message-ID: <Op5c#wkkAHA.381@cpmsnbbsa07>
Source record: 64837

I called Vectronics last week to find out if they were the same. After doing some looking in his files the guy I talked to told me they were not the same. He said the VEC-584B measures VSWR, resistance, and is a freq. counter. He also volunteered that he MFJ-259B does much more, directly measuring impedance, phase angle, capacitance, inductance, resonance, coax loss, etc.

After talking with Vectronics my impression is that the VEC-584B has the functionality of the older MFJ-259 but is in a 259B look alike case.

It came from CB sidebanders back in the mid-70s or so. They wanted to
talk like hams, but they didn't want to say "break" because it sounded
too much like AM CBers, so they started that idiotic "contact" crap when
they wanted to break in.

When I want to break in, I just give my call letters. It gets the job
done, and saves time letting people know who's breaking in.

Source record: 64836

The HTX-202 is a good, solid, reliable 2 meter H/H, built like a brick (and roughly the same size and weight <grin>). It has a tight front end and excellent audio with the needed features and not a lot of extraneous crap. The only drawback (if it is one) is that it's limited to the 2 meter ham band, no extended receive. This is why it has such a tight front end, the designers didn't have to broadband the receiver. I own two of them (as well as a HTX-404). One serves as a secondary base station in my bedroom (no, I'm not married), and the other is in a go-bag that holds my Skywarn/ARES maps and papers. They generally get around $100 on ebay, depending on condition and included accessories. I also own an ADI AT-600HP dualband H/H, and if the 600 were a Firebird, with T-tops, CD player, etc., then the 202 would be a 3/4 ton 4WD pickup with a 4-speed and no AC.

Source record: 64838

Greetings...

Up for trade is a beautiful Yaesu FT-920 with TXCO board and FM board installed. I am the original owner of this rig, and bought it in late November, 2000 from AES Milwaukee. Includes original box and manuals in perfect shape!

Looking to trade for another 'Big Rig'...in particular a Kenwood TS-870S, Kenwood TS-950SD, or perhaps an Icom IC-756. For the right deal I'll throw in the matching Yaesu MD-100A8C desk microphone, also bought new in November.

Reason for trade? I just like playing with new equipment! Would prefer an 'in-person' trade. I am within driving distance of Chicago, Milwaukee, Madison, WI, or perhaps even Twin Cities area if you want to meet half way. Will listen to offers from anywhere, however. E-mail w/ offers.

It depends on how old your VX5 is.
The early belt clips for the VX5 broke easily and
Yaesu came out with a new version that they were offering free.
I received one just by asking for it.
Good luck,
birt

The 50 MHz R/C equipment is already "narrow-banded" and was since the
50 MHz band's inception. The older 53 MHz gear is not, but it is not
required in that segment of the six meter band. I owned a couple of the
radios that you mentioned. They were good, reliable units.

South Normanton & District Amateur Radio Club,
in association with the G-QRP Club, are holding what
promises to be the year's main amateur radio event
in this area.
"Junction 28 QRP Convention", will be held on Saturday
17th March 2001, at the Village Hall Community Centre.
Market Street, South Normanton, near Alfreton in Derbyshire.
Located just 5 minutes from Junction 28 of the M1 motorway
and the A38, this will be a traditional radio event, organised
in the true spirit of amateur radio.
All under cover, there will be a good variety of stallholders
with components, kits, vintage and radio surplus, plus the
G-QRP Club stand, club stands and special interest groups.
There is a programme of lectures by Rev.george Dobbs G3RJV,
Rob Mannion G3XFD (Editor of Practical Wireless), Tex Swann
G1TEX (Also from Practical Wireless) and Douglas Pitt of the
Narrow Bandwidth TV Association (NBTVA) who will giving a talk
and live demonstration of mechanical television.
Hot and cold food and drinks will be available, plus a licensed bar.
Talk-in will be provided by GB0LOW on S22.
Doors open 10.00am.Admission is just ?1.00. FREE PRIZE DRAW.
Further details from the organiser on 01623 465443.
We look forward to seeing you there!

I agree with Mark, the HTX-202 is a great radio.. I've carried mine while four wheelin on my ATV or snowmaching in the outback of Alaska. I had other radios I could have carried but, when it could be a life or death situation at any time, I want a radio that I know will work when I turn it on.. I've actually hit repeaters at over 65 miles as the crow flies with nothin but the radio and a cheap mag mount antenna. On my excursions into the bush, I like to carry a 300 ohm ladder line J-pole and a few feet of coax so I can get that little bit more signal when I need it.

I also bought one of these for my wife to use. She carries hers with her most of the time and that's saying a lot. I really can't get her to carry anything else. I'm looking to upgrade to the Radio Shack dual bander but, that'll be a convenience radio.. When I need one for real situations, I'll grab my 202.

1972. FA: {LAST DAY} 1942 SCR-578 Gibson Girl Rescue Transmitter!!

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-09 17:32:36 UTC
From: radiotek@pacbell.net
Message-ID: <3a842879.77302674@news.nvbell.net>
Source record: 64748

I have a RARE 1942 SCR-578 Gibson Girl Rescue Transmitter for auction.
This is really an interesting item. It was used in WWII at sea for
crew lost at sea. As they would sit in their life raft, they would use
this transmitter to send out an SOS on 500 kHz. This was manufactured
by Bendix. The antenna was contained inside of a compartment. The
crewman would either fly a kite or inflate a baloon that was also
inside the compartment, to errect the antenna.

There was also a chemical kit to inflate the baloon. This transmitter
has an automatic mode for sending SOS or AA, and code also be manually
keyed by using this built-in keyer.

The price is very nice and there is NO RESERVE!

The auction will end around 10:30 AM Pacific Time today, Feb 09!

Please visit:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=551998662

Thank You & 73,

Mike KQ6MU

We need to limit our liability. Some folks will only serve in the club if it has the Non-Profit Organization corporate status for fear of being sued.

We went to an attorney and he wants $850 to lead us through the paperwork. Some say it is a process we could do ourselves, I don't know.

Another ham said it only transfers liability from the members to the board of directors of the "corporation" and they, in turn, would have to buy liability insurance to be protected from field day accidents / law suits and such.

I'm sure other clubs have been here and dealt with this before and we need to get some advice. We're in Tennessee state which will probably have bearing on the details. Thanks for any / all thoughts.

Respectfully, Johnny

Does any company make an A-B switch for HPIB or GPIB? I checked Agilent (HP) catalog and web site with no luck and a web search wasn't too helpful either.

Theory says I shouldn't need one, but I have a setup where it would be easier to install a switch than to find out what the problem is.

If you can offer any info or assistance, please let me know!

Best regards,

Michael Tracy, KC1SX, ARRL Lab

Don't know how things work in Tennessee, but in NC it's very simple to do it yourself. Just give a call to the Secretary of State for the state of Tennessee. That office is responsible for incorporating, and may have a nice information packet they can send you. You should also be able to find a book named something like "Incorporating yourself in Tennessee". Check the business section at the local Barnes and Noble or Borders, etc. I used a similar book for NC to answer all questions relating to incorporation.

Recently got into along dissertation with a gentleman from the Commission when I was referred to him by eBay. This was a result of I protesting my sale of a 2510 being cancelled. He passed along a copy of an official "Notice" with a list of 10M rigs considered illegal to "import, distribute" and I believe the word operate was in there as well. Along with the echo equipped Galaxies and Connex's, the 2510 and 2600 was listed. Apparently any radio which displays 27.065 to 27.405 in a "channelized" form after being modified is "clearly designed as a CB" and therefore requires a certificate of compliance for Part 95. Interestingly enough, I never got a straight answer when I asked what the status of my unmodified radio bought from a large Amatuer retailer prior to the date of the notice was. I also never got a very definitive answer as to the legality of my selling it (even to another ham).....only that the Commission understands that there are a few licensed hams who are in posession of these radios, and that is unfortunate but that's the way it is. So do we smash 'em with a big hammer? Sell 'em as fast an quietly as possible? Send them back to Uniden demanding a refund? Turn them in at a gun...er, radio "buy back" program in exchange for mall certificates?

ICOM IC-O2AT handheld in excellent condition. Late SN..Comes with a drop in type battery but no drop in charger. Battery is rechargeable with a cigarette lighter plug in cable which also operates the radio.The radio also includes all of my original shop and factory info on the O2AT series as well as a manual. The receiver has been opened up to receive the WX channels. My experience with ICOM covered 17 years in Dallas.

As far as the 2510 goes, just don't modify it - use it as intended, for licensed Amateur 10 meter operation. As for the RCI's, Galaxys', Connex, etc. your "big hammer" solution seems most appropriate...

Probably not the best rig for the price.It is very strong and can be
used as a hammer in an emergency but it covers only the ham band,only
has a few memories,the display is small and needs to be viewed straight
on,can be reduced to a useless hunk of plastic and metal by desense and
intermod,the 3 I have owned all failed but the first one which was a
used one.
I like the snazzy wrist strap.

A double break ("break, break") or triple break used to be used to
indicate priority or emergency traffic. The FCC doesn't have any
guidelines on the matter.

With freedom, comes responsibilty. Freebanders aren't acting responsible
when they interfere with other communications services. It's the "yelling fire"
cliche.

I do, however, have a problem with the FCC telling me what topics I may or may
not talk about. Example: During an interview several years ago, an FCC official
said that discussing controversial subjects over the amateur frequencies
basically violated 97.1(e), because such subjects, as he put it, "did nothing
to enhance international good will."

In article <t89648o0tkkp61@corp.supernews.com>, not@aol.com says...

This is a regional thing. I don't remember any SSB CB'ers using "contact" instead of "break" in the 70's (Washington, California, or North Carolina). And I haven't heard a single ham operator around here using it today, but I did hear it one time in Washington state recently.

Because it is so regional in nature, I really don't think we can so easily blame this on "those CB'ers." Instead, I suspect this is coming from somewhere within the ham community itself, or coming from plain language outside of radio.

> When I want to break in, I just give my
> call letters. It gets the job done, and
> saves time letting people know who's
> breaking in.

Most people do that, but I don't know how much it really saves time by letting people know who's breaking in. In my case, unless I already know the person (and callsign), I rarely ever catch the callsign of those breaking in this way.

On Fri, 9 Feb 2001 15:13:53 -0500,
in the newsgroup sci.electronics.equipment,
"Michael Tracy" <kc1sx@arrl.org>
from NETPLEX Internet Services - http://www.ntplx.net/ pressed
the keys in the following order:

> Does any company make an A-B switch for HPIB or GPIB? I checked Agilent (HP)
> catalog and web site with no luck and a web search wasn't too helpful either.

They do exists - but there is little demand for them these days.
I frequently see them in the surplus stores and fleamarkets. I
doubt if anyone is actively making them anymore.

They were very plentiful back in the days of HP pen plotters. I
know Black Box and Inmac made them.

www.blackbox.com
www.inmac.com

Also try searching with keywords like "black Box, Inmac, GPIB,
switch"

Also try IEEE-488 card vendors like National Instruments, IOtech
and Keithley.

Check your favorite surplus equipment dealers and Ebay.

> Theory says I shouldn't need one, but I have a setup where it would be easier
> to install a switch than to find out what the problem is.

What's the problem? Are you trying to use two talk-only machines
and one plotter? If the devices allow it - change to an addressed
system (define separate plotter and instrument addresses)

If it is an addressed system, make sure the two instruments have
different addresses. The GPIB bus is simple and does not handle
address conflicts very well.

Good Luck!

Cheers,
Paul Grohe

I have had one since they first sold them and they are a solid rig
EXCEPT for the cheesy wire that connects the center of the bnc to the
main board..VERY thin and easily broken, especially if you move it from
house to car..the people that never remove the rubber ducky never notice
it unless a really hard hit on the ant. It is also sensitive to front
end overload from a strong rf signal; I just popped mine with a 50w 6m
rig in the same car on different ants <ugh>. And, as one poster pointed
out, it doesn't do public service band receive. That would be nice,
particularly weather service. But, I do like the memory functions,
however limited to ? 13..It scans fast and you have 3 priority mems that
you can autocheck frequently. I own 2 of them.

What do you mean "...just don't modify it" ???

A licensed U.S. Amateur Radio Operator can take *any* piece of
electronic equipment, modify it to his/her heart's content, and
operate it in any amateur radio band where she/he has privileges.

There *are* emission 'purity' requirements -- which apply to *all*
amateur radio transmitting gear -- even that of the appliance
operators.

I have a TS 50 that I would like to put the "double zeros " on.
However the description I have says push the PF4 button on the mic...I
have a standard Kenwood mic, nothing but up and down...I guess its been
switched...is there any other way to perform the double zero program,
with out the multi button mic? THanks Murray

2037. Icom and Ameritron For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-10 20:39:31 UTC
From: "Marv Luse, AB0IO" <mwluse@dimensional.com>
Message-ID: <4Hhh6.1869$5s2.65537@wormhole.dimensional.com>
Source record: 64712

Hello,

I have some equipment for sale. It's not being used because I've upgraded to a Yaesu FT-1000 Mk V and Quadra amp.

(1) Icom IC-746 Tranceiver with Astron RS-35A power supply. Everything is in perfect working order and perfect cosmetically. Includes 2 optional Icom filters: FL100 (500 Hz CW) and FL223 (1.8 KHz SSB). Would like to get $1000 for everything, and I'll pay for shipping. Have original box for Icom, all manuals.

(2) Ameritron ALS-600 solid state HF amp (600 watts). Also in perfect working order and perfect cosmetically. All manuals, but no original boxes. (one note on this amp: it is SWR sensitive, prefers about 2.5:1 or better, so it works best with a well-tuned antenna or an antenna tuner. This is not a defect, just the nature of the beast.) Would like to get $700 and I'll pay shipping.

I used the setup above for about 1-1/2 years with a Butternut vertical and worked lots of DX. Busted my share of pileups, too. Would make a great starter setup. The 746 is a great rig for the money.

If anyone wants everything listed, I'll knock $100 off the combined prices.

Thanks and 73,

Marv
AB0IO

2046. Re: I heard a CB'er on 20 meters ("Break" as "pro sign")

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-10 23:52:27 UTC
From: Kathy <"John or Kathy Ryding"@southwind.net>
Message-ID: <3A85D423.73A7A112@southwind.net>
Source record: 64720

I think it may depend upon the area of the country. I don't travel a lot, but in my part of Kansas, "break" on 2 meters or 70 cm indicates emergency traffic. On HF, just your call sign should be enough. This is a procedure matter, one of common usage, not rules.

A tip for repeater users. Let the repeater drop occasionally to listen for emergency traffic. I have experienced needing to pass emergency traffic but have not been able to break into the conversation taking place because the other operators were too quick on the trigger.

My opinion.

From: lrbety@aol.com
Message-ID: <20010211012533.28685.00000429@ng-cn1.aol.com>
Source record: 64736

I have a beautiful condition 475 scope except it doesn't work and I don't have a maint. manual - yet.

If you have a manual maybe you could offer a suggestion to what is the problem to my scope.

Voltages missing:
+5
+15
-15
Incorrect Voltages
+50 V is 12.3 V
+110 V is 90 V
Ungregulated +50 V is +66 V

The internal fuse F1318 is ok
Of course, the mail line fuse is ok.

The only lights that will come on are the uncal lights on the front of the scope.

It's obviously missing some primary voltage.

Any ideas?

Thanks,
WA4QGA

Try writing them a nice letter stating, due to diminished mental ability resulting in your involuntary commitment to a state mental hospital, that you are no longer able to function as a reasoning amateur radio operator, so would they please cancel your membership and return any refund so you can pay for the electro-shock treatments. I'm sure the League will be very understanding.

73,
Mark

Well, Ken, some time ago on rec.radio.cb, someone was encouraging the "gang" to use a particular group of HF frequencies for their free-banding. I thought the list of frequencies looked familiar, then it struck me that he had listed the trans-Pacific and trans-Atlantic HF air-to-ground channels that Aeronautical Radio, Inc., uses to track long-range commercial airline passenger flights. When I pointed that out to him, explaining that he could possibly be endangering lives by encouraging HF free-banders to utilize those frequencies, I was flamed to a crisp.

Break whatever laws you desire, but in doing so, don't infringe upon other people's welfare and well-being.

2073. Re: illegal radios?

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-11 14:45:54 UTC
From: 3dflyer@my-deja.com
Message-ID: <9668j0$1p7$1@nnrp1.deja.com>
Source record: 64648

As an amateur radio operator, of General class or higher, I can legally design/assemble a radio transmitter/transceiver from junkbox parts and legally operate that rig on the amateur bands as long as the emission complies with FCC regulations.

It makes absolutely no sense at all that the FCC would tell me that I can assemble and operate a rig from junkbox parts, but that I cannot operate my HR-2600 radio as long as it complies with FCC emission standards. Someone is full of it, but not necessarily the author of this thread.

I can also sell my junkbox built radio to anyone I please, whether they hold an amateur radio operator's license or not. They only need an amateur radio operator's license to operate the junkbox radio on the amateur bands. They do not have to hold an amateur license to own it. eBay should get out of the law enforcement business and focus on their core business. Let the feds do their own police work.

Anyone can walk into an amateur radio store and buy an amateur radio legally. The store may not sell the equipment to someone without a license, but that is their option, not something mandated by law.

If the FCC is truly letting one of their representatives spout such nonsense, we are in deep trouble. Of course, any case prosecuted on such a basis would be tossed out of court in haste.

Personally, I do not feel that the FCC has sunk to such low standards. Me thinks someone is pulling our collective leg.

Source record: 64650

Hello,

I have some equipment for sale. It's not being used because I've upgraded to a 1000 Mk V / Quadra combo.

(1) Icom IC-746 Tranceiver with Astron RS-35A power supply. Everything is in perfect working order and perfect cosmetically. Includes 2 optional Icom filters: FL100 (500 Hz CW) and FL223 (1.8 KHz SSB). Would like to get $1000 for everything, and I'll pay for shipping. Have original box for Icom, all manuals.

(2) Ameritron ALS-600 solid state HF amp (600 watts). Also in perfect working order and perfect cosmetically. All manuals, but no original boxes. (one note on this amp: it is SWR sensitive, prefers about 2.5:1 or better, so it works best with a well-tuned antenna or an antenna tuner. This is not a defect, just the nature of the beast.) Would like to get $700 and I'll pay shipping.

I used the setup above for about 1-1/2 years with a Butternut vertical and worked lots of DX. Busted my share of pileups, too. Would make a great starter setup. The 746 is a great rig for the money.

If anyone wants everything listed, I'll knock $100 off the combined prices.

Thanks and 73,

Marv

2077. FS: Kenwood TK-230 public safety 100-ch VHF HT (field programmable) w/manuals

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-11 15:12:49 UTC
From: Keith Wood <kw@bctv.com>
Message-ID: <3A86ABF1.E8505FA2@bctv.com>
Source record: 64651

This is a good 5 watt radio, Kenwood's answer to the Saber, with similar features. Unfortunately, we are standardized on the Saber here, and I can't use it.

The radio is field-programmable from the keypad, and covers 150 - 174 (will actually go down into the 140 MHz range, but it's intended for public safety use so they don't mention this). 100 channels in 10 groups, with alphanumeric display.

Bells & whistles include programmable function switches, tone squelch and digital tone squelch.

The radio is in good shape, used, with three batteries of unknown quality. It also comes with the speaker mike, user manual AND Service Manual (including programming instructions).

$300 obo.

It's my opinion that if you bought one of these radios back when they were supposably "legal" to buy for ham use, you should have no trouble whatsoever. This law would only apply to a dealer who wanted to sell these radios today. A ham can use anything as long as it's clean and legal power. No question about that. If you have one of these radios that you bought earlier,I wouldn't even give it a thought. I'd just use it. I remember these radios being legally sold to hams. Just because the fcc might have decided to NOW not allow them to be sold by dealers, doesn't mean the one you legally bought is no longer legal to use. MK

Just heard some strip mall in the area of Ham Radio Outlet's
Newark De outlet burned to the ground last night. Was it them?
Hope not! Or did all that jap radio junk that's built inside like a
$69.95 K-Mart VCR gone up in smoke? Ham radio's dying anyway
so it's probably no loss in the long term. Try this sometime. Open the
hood of a Kenwood or Icom HF and a Daewoo or Hitachi VCR or TV
alongside of it. See the thru-hole components placed haphazard, chinzy cheap
wirebundle inter-connectors, unplated steel chassis that rust,
SMT resistors and caps placed at angles on the board and thin
polycarbonate plastic used everyplace in both. Difference is that hams
pay $1500 for HF rigs and everyone else pays $79.95 for identical components
and workmanship from the same jap factories.

2092. forsale: 3 handie talkies VHF for 50.00Us with shipping

Start by trolling in rec.radio.amateur.policy *only*.
rec.radio.amateur.antenna doesn't need this banality.
(It has enough of its own -- regrettably.)

>and workmanship from the same jap factories.

Now you've done it. You've blown the lid off of the big ham
manufacturing conspiracy haven't you? You're pretty astute. After all,
Kenwood and Icom make about as many ham rigs each year as Daewoo and
Hitachi do VCRs, right? So the price should be similar. They've been
ripping us off all this time. Darn those guys. Now that the word is
out we're going to have to pay $1500 for VCRs.

But why burn down a store in protest? If you really want to get rich
then get off of your bum and market a $79.95 HF rig. The entire
amateur community would beat a path to your door. You could sell them
at Best Buy or Circuit City, and the salesfolks there could provide
the necessary support and answer any questions hams (or prospective
hams) might have. I'd buy two or three of them every couple of years,
provided you include an 800 number for technical support and a 5 year
warranty. And making HF rigs is a much more honorable profession than
arson.

This is normal. The WallWart is a 'trickle' charger, it will not support transmit. This is documented on page 10 of the manual.

If you want to transmit, from external dc power, you need the E-DC-5B or E-DC-6 external DC power cables and an external DC supply capable of supplying an Amp or so of continuous current.

Jerry - You made the assumption that the twit (read troll) even has one to send back.

Of course when the moron looks under the hood of his "American" car, he doesn't have enough brains to know the air conditioner compressor on his "Mopar" is Mitsubishi or the speedometer on his Harley says "Nippon Seki" on the very bottom either.

I have a 3cx800A7 2m amp. its wired for 220. I want to change it to 110 here is all i know. There are 2 wires hooked up for 220 from the transformer but, there are 2 more a red/black and a white that are wire tied with the 220 ones and are soldered together. I do not have any information on this power supply for this amp. Its homebrew. How the heck can i figure out if this is possible to change it over? Anyhelp would be appreciated.

John:

It is hard to be sure what "tied with the 220 ones and are soldered together" means.

You probably have a transformer with dual primary windings. The two identical windings are wired in series for 220 and in parallel for 110. To find out, apply 220 volts as it is wired now and see if you have equal voltages across both windings. If you do, then all you need to do is rewire the windings in parallel and apply 110.

Let's say you have 4 wires on the primary and for convenience call them A, B, C, and D. For 220 operation B and C are connected together and the 220 volts is applied to A and D.

For 110 operation, you would tie A and C together, tie B and D together, and apply 110 volts to A/C and B/D.

Hope this helps,

Roger K6XQ

> possible to change it over? Anyhelp would be appreciated.

Maybe you should pull a 220 volt line in the shack and leave it alone.
I had a Yaesu amp that was putting out about 375 watts, when i finished
an 8877 homebrewed i had to get a line of 220 in the shack.
While testing the 8877 i blew the diodes so i rewired and hooked up the
much smaller Yaesu on 220.
SURPRISE!! close to 700 watts and that, because the HV was very stable
on 220
After that experience I am convinced no 120 volt for my amplifiers EVER
There are many ways to find the wires and phase the two windings
properly but i wouldn't give any one advise from the keyboard for
something that can hurt you.

2114. Newbie question on variable capacitors

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-12 02:43:41 UTC
From: LEE MIDDLETON <leemiddleton@home.com>
Message-ID: <x5Ih6.111465$KP3.30852064@news3.rdc1.on.home.com>
Source record: 64690
Cross-posted to:

I'm new to electronics and I am trying to build a small FM transmitter. The circut contains a 3-18 pF adjustable cap fo tuning. I can't seem to find any info on how these work. I assume that I turn what looks like a "screw head" inside, in order to change the capacitance. Does one turn cover the whole range, or many turns? Any information would be greatly apreciated

2115. Kenwood TS-930S Antenna Tuner range

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-12 03:21:41 UTC
From: mjlinden@mcs.net
Message-ID: <9FIh6.1454$jE2.171119@news.goodnet.com>
Source record: 64691

For those of you out there who own a Kenwood TS-930S with the automatic antenna tuner, how much of an SWR can the tuner match (I believe the tuner is 'satisfied' when it can achieve 1.2:1 or better)? The manuals I have for the radio say it can match 2:1 on one page and 3:1 on the other page?! Any input would be appreciated.

Thanks, Michael N9BDF

There's different types. If its the type that just continues
rotating with no stop, then the range 3-18 pf will be in 180
degrees of rotation. Lets say you're going clockwise, it will
increase from 3 to 18pf and as you pass the halfway point it will
start decreasing back to 3pf. If you cannot see the moving
plates, its hard to determine where max and min are.
A compression trimmer will have a screw that will usually
"tighten" if you go clockwise 6 or 8 turns. Thats max capacity.

Be sure to phase the two windings properly, or you will re-enact the big bang. Best and safest way I know of to make sure they are in phase is to hook an audio generator to one set of windings and a scope to the FILAMENT windings of the secondary. Try connecting the second set of primary windings to the first, if the the output waveform drops only a little (due to loading) then you are in phase... if it drops off sharply or disappears, you are out of phases, turn the wires around.

Also, though undocumented, you can transmit on low power with the
wall-wart.

HI Lee.

I think that the capacitor is probably one of those that you just turn it one in order to go from 3 to 18 pf. But just to be on the safe side you can do this little experiment to see if my theory is correct.

Hook up a 50 MEGA ohm resistor in series with the cap and attach it a 12 VAC voltage source. The esiest thing for the AC source is a transformer. If you can get a function generator and set the frequency higher then you could use a smaller value resistor, but the transformer is fine. Now, assuming the frequency of the transformer is at 60 Hz you should get these readings.

When the Cap is at 18 pF then the voltage drop across the resistor should be about 3.86 v. When the cap is at 3 pF then the voltage drop across the resistor should be 0.67 v. This way you will know when the 3 pF starts and when the 18 pF ends.

If you don't get the same values then remember that the higher the value of the cap the higher the voltege drope across the resistor.

For those that lack a signal generator, and scope, a doorbell
transformer works nicely. It is constructed in such a manner that a
short on the secondary is self limiting. The lower voltage also adds to
the safety factor.

It allows checking for winding phasing, approximation of turns ratio,
etc.

Lee,
Sounds like your talking about a 'trimmer' capacitor. If
so, then they usually have a multi-turn adjustment.
'Doc

Remember you will have to provide twice the amperage to the unit
if you run it on 110 volts. IF your unit is on a 15 amp 220 volt line
you will need to run 30 amps at 110 volts using at least #10 wire
and change the wall outlet to a 30 amp type nema and the male plug too.

It could be easier to run a new #12 line for 220 to the station if you
have spare spaces in your panel box. You may want to contact a
licensed electrician if you are not able to do this job on your own.

2134. Inquiry - HW-101 With power and Yaesu Mike and Astatic Mike

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-12 18:38:49 UTC
From: Curtis Scholl <cscholl@izzy.net>
Message-ID: <3A882DB9.9E69BB28@izzy.net>
Source record: 64559

Hi Folks:

I want to sell my HW 101. I just don't have the time for rag chewing and QSL hunting anymore. I thought I had enough time, but I am more involved with amateur rocketry now and need the time for building tracking transmitters on the VHF/UHF bands.

The 101 is in good condition, works on all bands, 80-10 and may need some tuneup, but I haven't had many problems with it. It was modified by the previous owners by the addition of a power switch on the inside of the upper case, a push button on, push off, to replace a failed original pot switch.

This unit is a workhorse not a pristine vanity piece. And it has "character" in the form of a leg missing on the CW filter switch. The power supply is decent, and the power cable is a rebuild.

Does anyone out there have any desire to own this unit? Please reply by email to cscholl@izzy.net

Thanks

Curtis Scholl

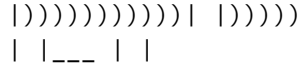
I have read transformer help with interest.
First if it is indeed a duel voltage transformer then it will be wired:-



So connect 1 & 3 Plus 2 & 4 to convert to 110 volts.
I see talk of 220 volt as if it can be got with ease.
In UK the 110 volt gear is for industry only and domestic is all 230 volt
+6 -10
The 110 volt is centre tapped being 55-0-55 or 64-0-64 if from a three phase transformer. In Algeria it was 190 volt between phases and 110 volt phase to centre tapping. Can someone explain the US system as it seems very different from what I have worked with to date.

In Michigan and many other states it is unlawful to have "scanner type" radios in automobiles capable of receiving police transmissions, unless you fall under certain exections. In all states I believe that if you are a licensed amateur radio operator (at Tech class or higher in MI) you may have such a radio in your car. No law that I am aware of in MI anyway, prevents you from listening to cops at home.

As of late, it seems that when I read police reports on drug busts, the cops always have to comment on the fact that they also confiscated money, guns and scanners. Oftentimes the money was from just cashing a legit pay check (one time a guy just sold his car for cash) the gun was an antique passed down from grandpa and the scanner was the kid's. The cops still make a big deal out of it because the scanner had "their freqs" in it. On the other hand, they used scrambled cell phones to coordinate the raid, so what was there to listen to on a scanner anyway?

Find your state's law, copy it, put it in your dash box with a copy of your ham license. Most cops are not even aware of the law, and if they are, don't know the exceptions. It also helps to have a ham who is a cop educate the rest of his police department!

Mine is set up the same way--fan on tx + auto. It gets very warm some
times, but only on long key downs on high power. Never had the burning
rubber smell tho! I find that locally, the second from lowest power setting
gets me into most of the repeaters full quieting so that is where I leave
it. No problems with my mic. Great little radio!

After marketing our wind-up reel antenna for SWL's, several hams have approached us about manufacturing a DIPOLE model. So we've done just that and call it the "YoYo-Tenna Deluxe". We've taken two of our YoYo-Tenna wind-up antennas and combined them into a PL-259 coax fitting. You can add coax...or...just plug it straight into your rig or tuner! 40 ft. per reel, so operation is from 10 thru 40 meters. (One ham suggested "stacking" them...or running them in series to cover 75/80 and 160. I'll leave that up to you guys...) If you want to see what a single reel looks like, please visit our website. - http://qth.com/dwm - Remember, no shipping and handling will be charged on the Deluxe model since you are ordering two...and we give free shipping on two or more YoYo-Tennas. (Total cost - $29.90)

Thanks for your time and 73!

Bill - WA8MEA @ Jackson Co., Michigan QRP Club Station - KC8BCR

Eric..
In the US, we use 120 VAC for our household mains, with the 120 V being derived from a split phase 240 V mains drop from the pole. (120/0/120) with a neutral and an earth ground. Our 3 phase power (the low voltage stuff) is 240 V between phases and 120 V between any phase and neutral (for Delta circuits) and 240 V between any two phases and I believe 177 V between any phase and neutral (for Wye circuits) but I may be wrong about the last. We get 240 V for appliances by using the split phase 240V mains drop without the neutral.

I think the cops are using reverse psychology here. Make the bad guys think a
scanner is highly useful and lull them into a false sense of security. If I
were a cop, that's what I'd do. Have 99% of the routine radio traffic in the
open and the critical 1% scrambled.

Hi,

Interesting problem. I have not heard of this problem. Make sure the Tx Save is "Off" (menu 15). This option will lower your power output based on the s-meter receive of the repeater. It the repeater is def, if may not hear the HT on lower power. This is only a guess.

shared these priceless pearls of wisdom:

->Sorry Doc! But every rig I have here now and have ever had - trimmers are
->NOT multi turn.

Most vintage and some notsovintage radios have the Arco mica trimmers in them
and they are all multiturn multiplate capacitors. As you get up into microwave,
the quality piston trimmers (JFD et al) are all multiturn.

> from what I have worked with to date.

Simply said, the service transformer secondary is a centertapped 240
volt winding, and the center tap is the neutral, which is grounded. All
120 volt service comes from one or the other side of the secondary and
the center tap neutral. Approximately half of the 120 volt houshold load
is placed on each side.
240 volt service uses the entire secondary, with the center tap also
connecting to the equipment frame as a safety ground. Both "hot" 240
volt lead are is fused, and any short circuit to the frame will blow a
fuse. Serparate house wiring is needed for appliances using 240 volt
service.

Note that there is a third wire, a safety ground wire, included at each
120 volt outlet which also returns to the neutral (center tap). The
neutral and ground wires in the 120 volt service lines are at the same
'ground' level, but both are maintained for safety. Under certain fault
conditions this can be of vital safety importance. 120 volt lines are
single fused.

120 volt curcuits have one 'hot' wire and two 'ground' wires, typically
three number 10 wires, or larger for heavier applications.
240 volt circuits have two 'hot' wires and one 'ground' wire, typically
three number 12 wires.

Hope this helps.

Dick W0EX

2164. WTD: DOW KEY ANTENNA RELAY

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-13 05:12:29 UTC

Source record: 64591

Greetings...
I've had a few bites, but nothing concrete yet. Still looking for offers.

Up for trade is a beautiful Yaesu FT-920 with TXCO board and FM board installed. I am the original owner of this rig, and bought it in late November, 2000 from AES Milwaukee. Includes original box and manuals in perfect shape!

Looking to trade for another 'Big Rig'...in particular a Kenwood TS-870S, Kenwood TS-950SD, or perhaps an Icom IC-756. For the right deal I'll throw in the matching Yaesu MD-100A8C desk microphone, also bought new in November.

Reason for trade? I just like playing with new equipment! Would prefer an 'in-person' trade. I am within driving distance of Chicago, Milwaukee, Madison, WI, or perhaps even Twin Cities area if you want to meet half way. Will listen to offers from anywhere, however. E-mail w/ offers.

I don't have em, and if no one comes forward, try the manual vendors on the
web e.g., W7FG
http://www.w7fg.com/cgibin/cat.cgi?find=K
About $21 to $27.

Also you might find them on E-Bay.

For further choices of manual vendors
See URL:
http://ac6v.com/manuals.htm
You can find manuals here for just about any radio gear.
I have no pecuniary interest in any of the listings.

2176. Re: Opinions on Icom IC-W32A HT wanted

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-13 14:20:52 UTC
From: Eddie Bryant N4UMJ <N4UMJ@carolina.rr.com>
Message-ID: <8pbi6.73306$p8.17925714@typhoon.southeast.rr.com>
Source record: 64603

Just don't hook an external antenna to it. I have two of
these W32a HT's and they both overload very badly
when an external antenna is connected to them. This is
evidenced by the radio being desensitized and not
receiving previously received signals with the rubber
duck attached. This may or may not happen to you in
your area. ICOM has a note regarding this on their
website in the FAQ section.

http://www.icomamerica.com/support/faq/amateurfaqs.html

See the below yahoo groups page on the W32a for more:

http://groups.yahoo.com/group/ic-w32a

With the supplied rubber duck it is one great HT!
I love the size and the backlit keypad.
The computer interface is great too.

If you find an older used one you can get the 800 Mhz
receive as well. This is blocked on the newer models
due to the newer FCC and Part 15 scanner receiver image
rejection standards and regulations.

Brenda Ann,
You have it almost correct.
In three phase 240 volt delta - phase to phase is 240 volt. If one phase has a center tap, then that center tap should be bonded to ground and you have 120 volts from that tap (neutral) and either side of that phase. Connections from the center tap to the third leg is not used and that third leg is called, the high leg, 180 leg, etc. because it measures about 200 volts to ground or neutral.
In three phase Wye or Star - Each phase is connected to a center point which is bonded to ground and is the neutral. Each phase to neutral is 110 volts. Each phase to phase is 208 volts. Wye systems allow you to use all three phases for 110 volt use.
Rich
>
> Eric..
> In the US, we use 120 VAC for our household mains, with the 120 V being

I think you need new judges Jeff. For a troll, it wasn't very earth shattering, only about 1.2 on the Richter Scale. It was more like a 'shot across the Bow'. A true troll spawns a life of its own, a thread from hell that just won't die. Yup, Yer meter needs a bit of tweaking.

Hard to say. You'll probably need different sizes of wire, in addition to coil forms that would fit your meter. You might find a better deal if you just go to:

http://listings.ebay.com/aw/listings/list/all/category4670/index.html

and enter "dip meter" in the search engine. Lotta such critters going for next to nothing -- with coils...

Source record: 64616

The W32A isn't a bad radio. Speaker is too small so if you're walking around with it on your belt in a mall or at a hamfest, you won't hear a call. (Get an earphone!) I once hooked up a good 5" external speaker to mine. With the volume up full, folks half a block away looked to see where the talk was coming from. That was my only complaint though others with big hands have complained about the tiny keys spaced so close together.

80-10 meters are fine. We're in a good sunspot place so DX is pretty good. I'm sure the comments you heard refer to a lot of a**holes who gripe, complain, use foul language etc. There is a LOT more of that than there was 30-40 years ago. The art of being a gentleman seems lost on much of the HF spectrum. But, that said, you can also always find some nice folks to chat with. HF rigs of today allow you to dial in the frequency you want and be "dead on." Most include automatic antenna tuners and all-around are light years ahead of --MOST of-- the older stuff. Don't bypass HF... you'll enjoy it.

2191. Attaching extra wires to a side-terminal battery

Newsgroup: rec.radio.amateur.equipment
Date: 2001-02-13 20:57:10 UTC
From: Dick Grady <grady@wizard.com>
Message-ID: <qp7j8t47sq0ukrd74109egc8j5rjuo5a0v@4ax.com>
Source record: 64619

I own a 1999 Chevy Tahoe (truck-based station wagon). The battery has terminals on the side, with bolts holding the cables to the battery. There are no terminal posts. I want to power my new HF mobile transceiver directly from the battery terminals, but I'm having difficulty connecting the transceiver's power wires. Eventually, I want to connect several things here, such as VHF radios, computers, GPS receivers, etc.

I tried an adapter about 3/16 inch thick, which fits over the bolts and has screw terminals for other wires. But then the bolts were too short. The bolts of the original equipment cables are captive (at least I could remove then from the battery cables), so I could not use longer bolts. And in any case, the positive terminal already has 2 wires, and the addition of the adapter would require a bolt longer that those stocked by my local auto-parts stores.

I tried a thin metal plate with 1/4-inch lugs for slide-on terminals (bought it at Radio Shack). Now I could bolt the cables to the battery. I attached the radio wires with slide-on terminals, and on a test drive one of the slide-on terminals came off; this was on paved streets and gravel roads; and I want to use this arrangement on rough terrain off-road.

What I need is an adapter which screws into the battery, and which has a threaded hole to accept the original equipment bolts. Any idea where I can get these?

Or does anyone have any other suggestions?

Buying another battery with both side and post terminals has already been suggested, but is not an option because this battery is only 1.5 years old, and I don't want to throw away a perfectly good battery.

Go to AutoZone or another automotive specialty chain in your area;
these adaptors are standard hardware. Good luck.

Go to a local shop that installs high powered auto stereo equipment.
They'll have all the things you need. Or try www.crutchfield.com,
they list these things in their print catalogs.

I was wondering if anyone has had an ICOM 25A 2M rig that the offset is messed up on and if you know of any fixes for it. I'm thinking it's just a loose connection I just haven't had time to check. When I key up whether simplex or duplex is pressed it offsets up 600K and if I offset it to be plus it offsets 1200K. Any suggestions would be greatly appreciated.

>and lighter wieght. Any ideas?

Which fast charger do you have, the Yaesu NC-50? Yaesu says that it is
not designed for charging NiMH batteries. NiMH cells show less voltage
drop at the end of charge, so a charger designed for NiCd cells might not
shut off properly every time when charging NiMH. And the FT-50 packs
don't seem to have any sort of thermistor for sensing temperature either,
so the charger can't use that to detect end of charge. So, there's some
risk of overheating and damage if you use a NiMH pack in the NC-50.

But the NiMH packs will work fine with the CA-15, which is just a 90 mA
constant-current charger.

If you absolutely have to have 5 W of output power, you need 9.6 V.
A NiMH 9.6 V pack will be lighter and probably have more capacity than
a NiCd pack. But if you can tolerate a little less power, you might
be happier with a 6 V or 7.2 V pack that is smaller and lighter.
I almost never use the 9.6 V pack on my FT-50 because it's so thick
and heavy.

Dave

Looking for info on a low audio problem with an Icom 746 when using SSB. No ALC indication on the meter unless I use compression. I've tried a new mike and found no differance. Any help would be appreciated.

Maybe I'm lucky, but I've always received prompt (24-48 hours) from
both Yaesu and Kenwood. Don't know about ICOM. YMMV.
